#### Discovery and insights (Preview)

Discovery and insights find privileged role assignments in Privileged Identity Management (PIM).

#### Key Concepts

- What is PIM and how should I secure it?
- What are eligible role assignments?
- How can I use access reviews to manage my assignments?

#### Discovered assignments in Default Directory

Refresh

**3 permanent global administrator assignments**

Microsoft recommends you to keep fewer than 5 standing global admins with 2 of them reserved for break glass scenarios.

[Reduce global administrators](#)

### Global Administrator

People in the Global Administrator role can access and modify data across all Microsoft 365 services, and they can also obtain access to Azure resources. To improve your company's security posture, Microsoft recommends that you keep only two standing global administrators for break glass scenarios. People who need Global Administrator permissions should either be made eligible for just in time elevation into the role or assigned to less-privileged role.

#### Global Administrator

#### Require activation for global administrator

You can quickly reduce the number of permanent global administrator role assignments right now by making them eligible for the role in Privileged Identity Management (PIM) or by removing them from the role.

Search by name or email

Name	Email
<input type="checkbox"/> Admin	admin@contoso.onmicrosoft.com
<input type="checkbox"/> Bob Thompson	bobt@contoso.onmicrosoft.com
<input type="checkbox"/> Sarah Thompson	sarth@contoso.onmicrosoft.com

Make eligible Remove assignment

#### Ask all global administrator to review their access

You can use Azure AD access reviews to verify that they still need global administrator role. The Create button sends an email to require all users in a global administrator role to provide a business justification in the Azure portal for their role assignment.

**Manage keys and secrets used by apps and services**

Our recommendation is to use a vault per application per environment (Development, Pre-Production and Production). This helps you to not share secrets across environments and also reduces the threat in case of a breach.

### Logout URL

This is where we send a request to have the application clear the user's session data. This is required for single sign-out to work correctly.

### Implicit grant

Allows an application to request a token directly from the authorization endpoint. Checking Access tokens and ID tokens is recommended only if the application has a single-page architecture (SPA), has no back-end components, does not use the latest version of MSAL.js with auth code flow, or it invokes a web API via JavaScript. ID Token is needed for ASP.NET Core Web Apps. [Learn more about the implicit grant flow](#)

To enable the implicit grant flow, select the tokens you would like to be issued by the authorization endpoint:

- Access tokens
- ID tokens

**System assigned**   User assigned

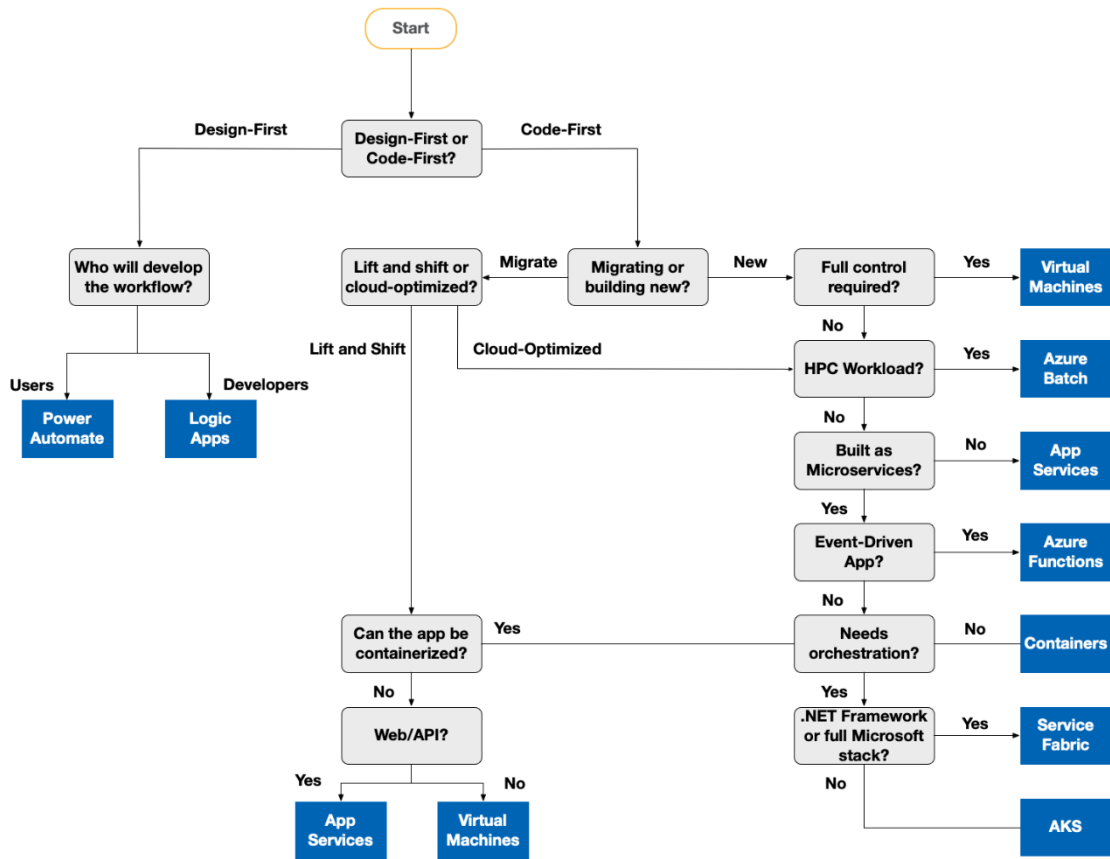

A system assigned managed identity enables Azure resources to authenticate to cloud services (e.g. Azure Key Vault) without storing credentials in code. Once enabled, all necessary permissions can be granted via Azure role-based-access-control. The lifecycle of this type of managed identity is tied to the lifecycle of this resource. Additionally, each resource (e.g. Virtual Machine) can only have one system assigned managed identity. [Learn more about Managed identities.](#)

⚠ The confidence rating of the assessment is low, ensure that you wait for at least a day after starting discovery, before creating performance-based assessments. [Learn more.](#)

Essentials

Over 5 year(s) with Microsoft Azure, your estimated cost savings could be as much as **US\$69,339**

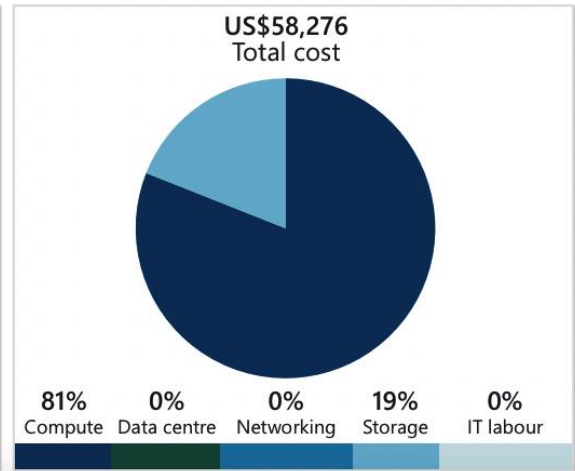

**Total on-premises over 5 year(s)**

TCO of on-premises environments tends to be driven by compute and data centre costs.

**Total Azure cost over 5 year(s)**

In Azure, certain cost categories decrease or go away completely.

This screenshot shows the configuration for a 'Copy data' activity in Azure Data Factory. The left sidebar lists 'Factory Resources' including Pipelines (1), Datasets (2), Data flows (0), and Power Query (Preview) (0). The 'CopyRockers' pipeline is selected. The main area shows the 'Copy data' activity configuration with tabs for General, Source, Sink, Mapping, Settings, and User properties. The 'Mapping' tab is active, showing a table with columns from the source mapped to the destination.

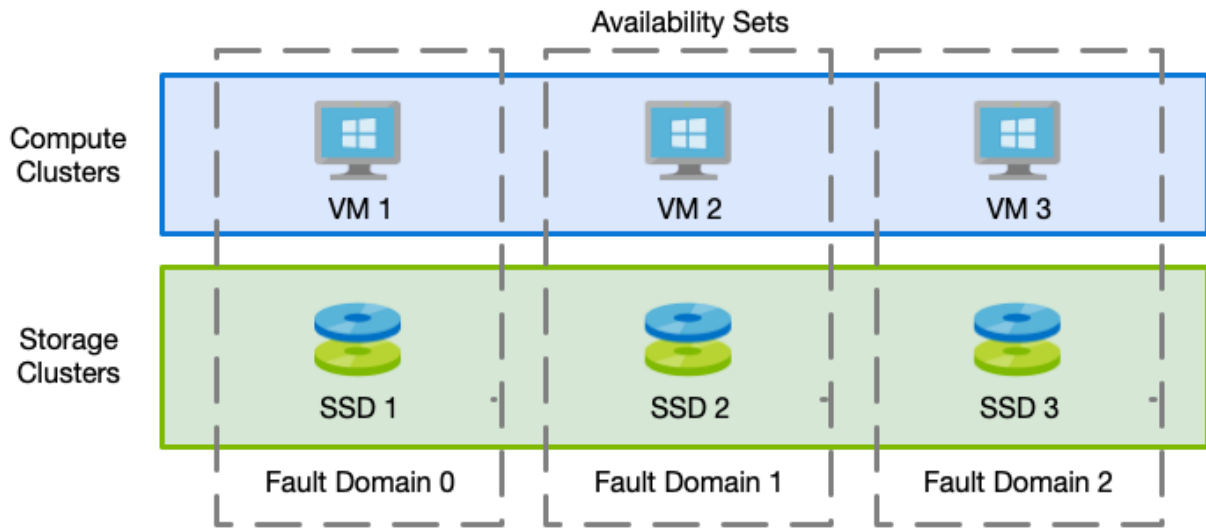

Source	Type	Destination
Id	Int32	Id
FirstName	String	FirstName
Surname	String	Surname
DOB	DateTime	DOB

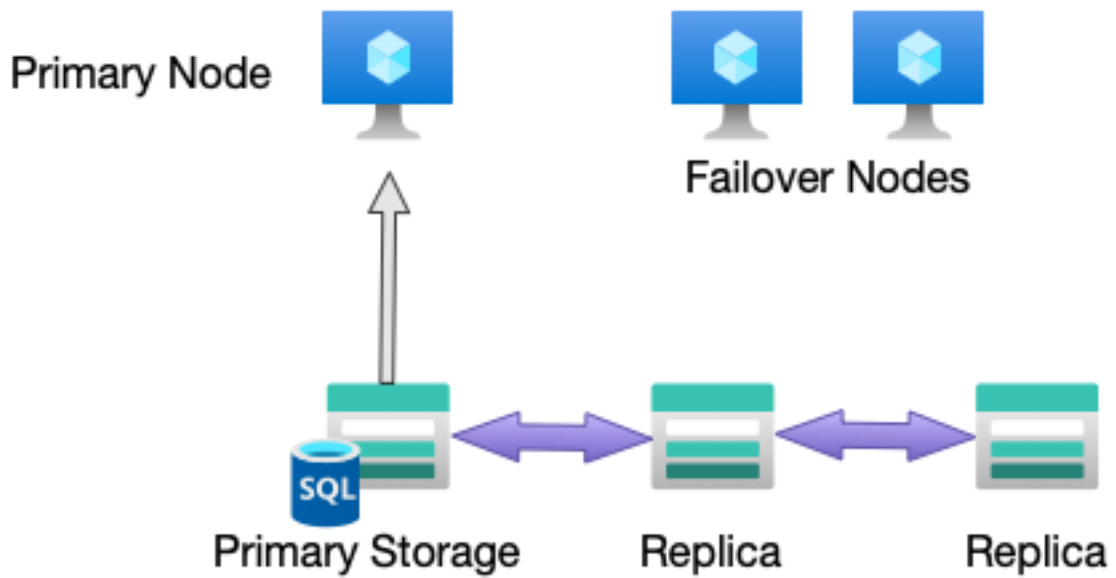

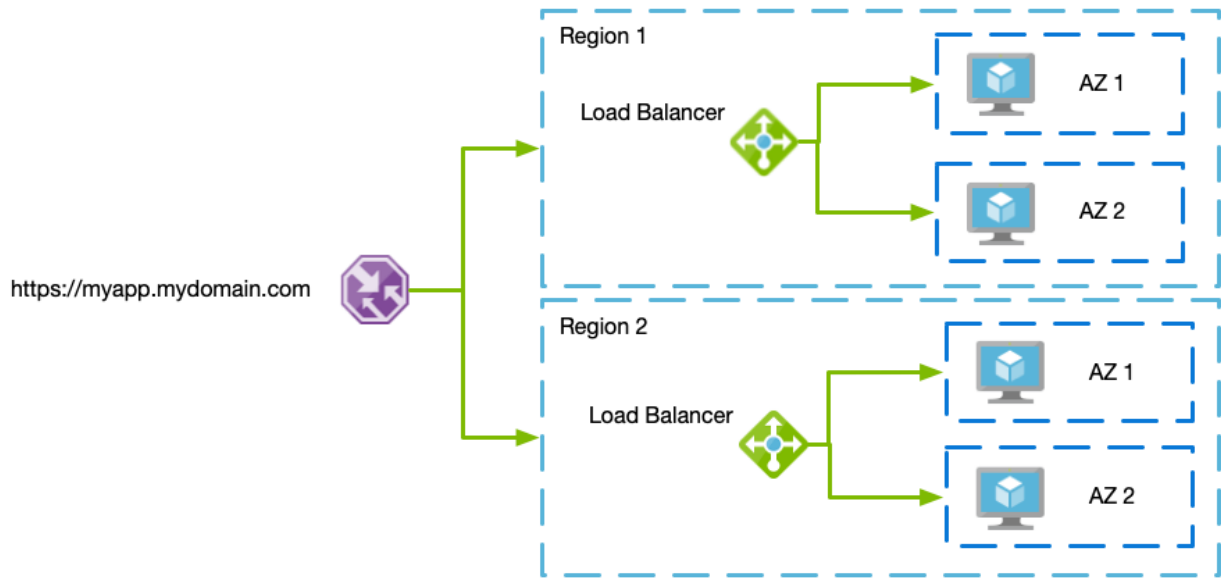

This screenshot shows a pipeline visualization in Azure Data Factory. The pipeline is named 'pipeline1' and contains a 'CombineData' activity. The 'CombineData' activity is expanded to show three data flows: 'RockersSource' (Import data from RockersCSV), 'RockersJoin' (Inner join on RockersSource and GigsCSV), and 'SQLSource' (Columns: 7 total). A reference box indicates 'Reference: 1' and 'Columns: 4 total'. The 'Factory Resources' sidebar on the left shows Pipelines (1), Datasets (3), and Data flows (1).

STRONG BOUNDED STALENESS SESSION CONSISTENT PREFIX **EVENTUAL**

**i** Eventual consistency is the weakest form of consistency wherein a client may get the values which are older than the ones it had seen before, over time. [↗](#)

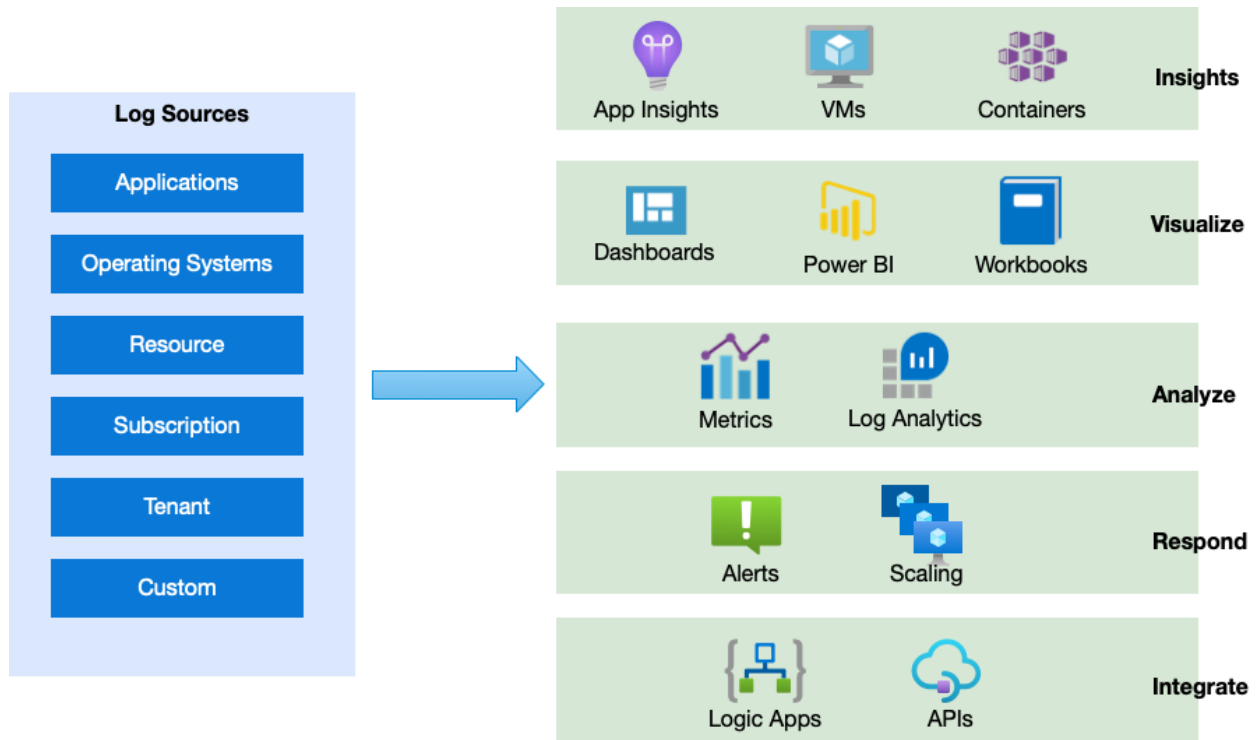

- Settings
- Default consistency
  - Backup & Restore
  - Firewall and virtual networks
  - Private Endpoint Connections
  - CORS

**Understand Eventual consistency**

In the absence of any further writes, the replicas within the group will eventually converge.  
 Eventual consistency is ideal where the application does not require any ordering guarantees. Examples include count of Retweets, Likes or non-threaded comments.

# Chapter 15: Designing for Logging and Monitoring

## Diagnostic setting

Save Discard Delete Feedback

A diagnostic setting specifies a list of categories of platform logs and/or metrics that you want to collect from a subscription, and one or more destinations that you would stream them to. Normal usage charges for the destination will occur. [Learn more about the different log categories and contents of those logs](#)

### Get more visibility into the health and performance of your virtual machine

With an Azure virtual machine you get host CPU, disk and up/down state of your VMs out of the box. Enabling additional monitoring capabilities provides insights into the performance and dependencies for your virtual machines.

You will be billed based on the amount of data ingested and your data retention settings. It can take between 5-10 minutes to configure the virtual machine and the monitoring data to appear.

**The VM is not connected to any workspace. Please select the monitoring workspace where you will store your data**

Workspace Subscription \*

Choose a Log Analytics Workspace

Note: If the virtual machine already has either SCOM or OMS agent installed locally, the Microsoft Monitoring Agent (MMA) extension will still be installed and connected to the configured workspace.

**i** The map data set collected with Azure Monitor for VMs is intended to be infrastructure data about the resources being deployed and monitored. For details on data collected please [click here](#).

### Point-in-time-restore

Specify how long you want to keep your point-in-time backups. [Learn more](#)

How long would you like PITR backups to be kept? ⓘ

35 Days

### Long-term retention

Specify how long you want to keep your long-term retention backups. You may choose to keep yearly backups for up to 10 years. [Learn more](#)

#### Weekly LTR Backups

Keep weekly backups for:

#### Monthly LTR Backups

Keep the first backup of each month for:

#### Yearly LTR Backups

Keep an annual backup for:

Which weekly backup of the year would you like to keep?

### Backup Interval

How often would you like your backups to be performed?

 Minute(s)   
60-1440

### Backup Retention

How long would you like your backups to be saved?

 Hours(s)   
8-720

Copies of data retained 2

Backup storage redundancy \* 

- Geo-redundant backup storage
- Zone-redundant backup storage
- Locally-redundant backup storage

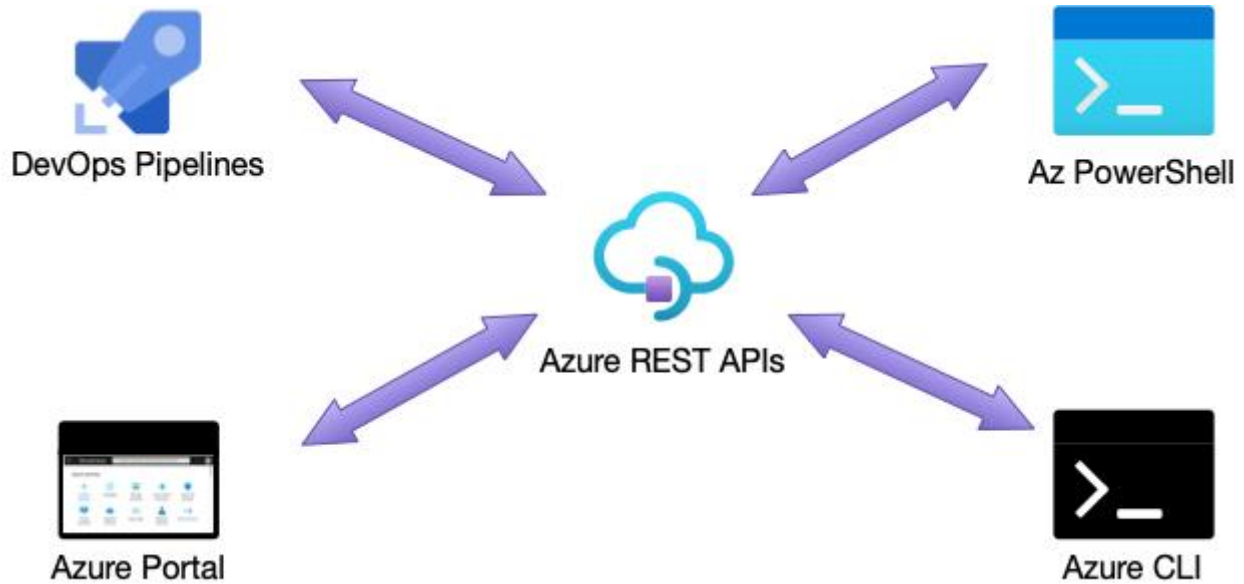

Details Base blobs

Lifecycle management uses your rules to automatically move blobs to cooler tiers or to delete them. If you create multiple rules, the associated actions must be implemented in tier order (from hot to cool storage, then archive, then deletion).
