Select Cluster Template

Managed Clusters

Standard Managed Cluster

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

Create

Managed GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

Create

Elastic Bare Metal Cluster

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

Create

Windows Cluster (Beta)

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

Create

Other Clusters

Standard Dedicated

Cluster

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

Create

Dedicated GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

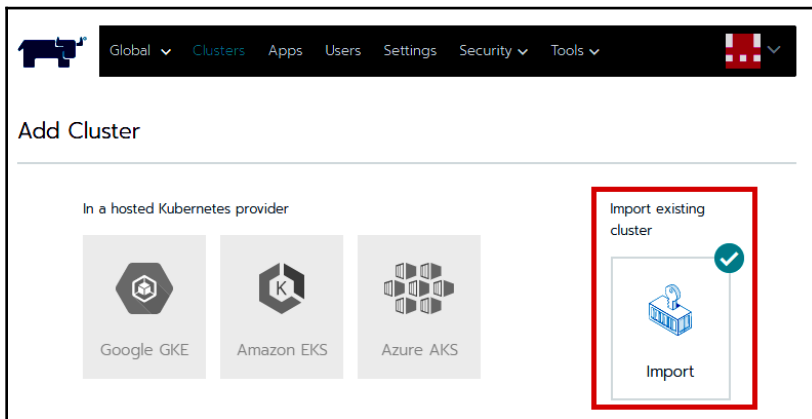

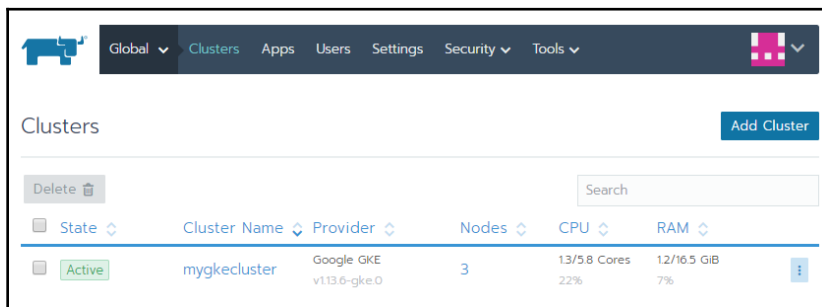

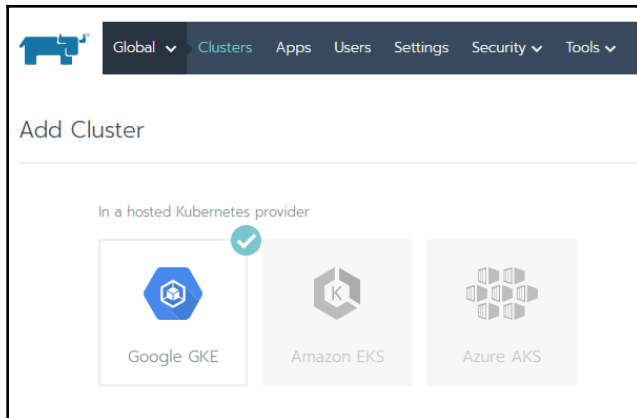

Create

Standard Serverless

Cluster

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

Create

```
curl --insecure -sfl
https://54.184.9.87/v3/import/5nvrch6x66xgqfj5nh5ghwt1lvhf9v6gwbnj7qb69jtp19v8c2bn.yaml
| kubectl apply -f -
```

Done

Welcome to GitLab

Code, test, and deploy together

Create a project

Projects are where you store your code, access issues, wiki and other features of GitLab.

Create a group

Groups are a great way to organize projects and people.

Add people

Add your team members and others to GitLab.

Configure GitLab

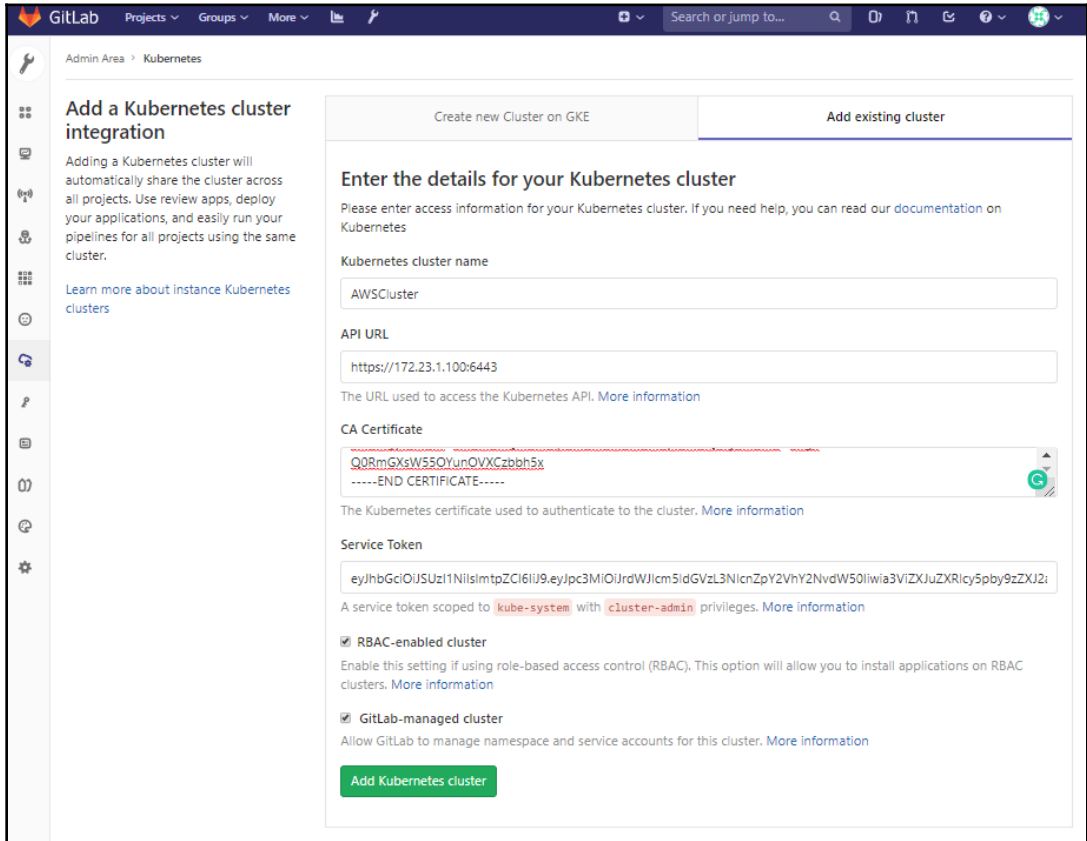

Make adjustments to how your GitLab instance is set up.

Integrate Kubernetes cluster automation

Kubernetes clusters allow you to use review apps, deploy your applications, run your pipelines, and much more in an easy way. Adding an integration will share the cluster across all projects. [Learn more about instance Kubernetes clusters](#)

[Add Kubernetes cluster](#)

Applications

Choose which applications to install on your Kubernetes cluster. Helm Tiller is required to install any of the following applications. [More information](#)

Helm Tiller

Helm streamlines installing and managing Kubernetes applications. Tiller runs inside of your Kubernetes Cluster, and manages releases of your charts.

Install

You must first install Helm Tiller before installing the applications below

2 > Upgrade note:

3 * Due to the change in default access mode, existing users will have to specify `ReadWriteMany` as the access mode. For example:

4 ```

5 gitlabDataAccessMode=ReadWriteMany

6 gitlabRegistryAccessMode=ReadWriteMany

7 gitlabConfigAccessMode=ReadWriteMany

8 ```

9

10 * Sets the default access mode for `gitlab-storage`, `gitlab-registry-storage`, and `gitlab-config-storage` to be `ReadWriteOnce` to be compatible with Kubernetes 1.7.0+.

11 * The parameter name to configure the size of the `gitlab-storage` PVC has changed from `gitlabRailsStorageSize` to `gitlabDataStorageSize`. For backwards compatability, `gitlabRailsStorageSize` will still apply provided `gitlabDataStorageSize` is undefined.ggdgd

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

Select Cluster Template ✕

Managed Clusters

 **Standard Managed Cluster**

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

[Create](#)

 **Managed GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Elastic Bare Metal Cluster**

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

[Create](#)

 **Windows Cluster (Beta)**

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

[Create](#)

Other Clusters

 **Standard Dedicated Cluster**

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

[Create](#)

 **Dedicated GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Standard Serverless Cluster**

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

HTTPS Git credentials for AWS CodeCommit

Generate a user name and password you can use to authenticate HTTPS store up to 2 sets of credentials. [Learn more](#)

Generate

Git credentials generated ✕

IAM has generated a user name and password for you to use when authenticating to AWS CodeCommit. You can use these credentials when connecting to AWS CodeCommit from your local computer and from tools that require a static user name and password. [Learn more](#)

User name muratkarslioglu-at-316621595114

Password ***** [Show](#)

This is the only time the password will be available to view, copy, or download. We recommend downloading these credentials and storing the file in a secure location. You can reset the password in IAM at any time.

[Download credentials](#) [Close](#)

The screenshot shows the AWS console navigation menu. At the top, there is the AWS logo, a 'Services' dropdown menu, and a 'Resources' link. Below this, the 'Developer Tools' section is expanded, showing a list of services. 'CodeBuild' is selected and highlighted. Under 'CodeBuild', there are several options: 'Source • CodeCommit', 'Build • CodeBuild' (which is expanded), 'Getting started', 'Build projects' (highlighted in orange), 'Build history', and 'Account metrics'.

The screenshot shows the 'Build projects' page in the AWS console. The breadcrumb navigation at the top reads 'Developer Tools > CodeBuild > Build projects'. Below the breadcrumb, there is a search bar with a magnifying glass icon. To the right of the search bar are several buttons: 'Start build', 'View details', 'Edit' (with a dropdown arrow), 'Delete', and 'Create build project' (highlighted in orange). At the bottom right, there are navigation arrows and the number '1'.

Cloud Build

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

Generic Chaos ▾

Kubernetes is an open-source system for automating deployment, scaling, and management of containerized applications. It groups containers that make up an application into logical units for easy management and discovery. Install will all the experiments which can be used to inject chaos into containerized applications.

Description

The screenshot shows a dashboard for 'K8sDevOpsCookbook'. On the left is a navigation sidebar with icons for Team, Personal, Projects, and Settings. The main content area has a header 'K8sDevOpsCookbook' with a dropdown for 'All teams'. Below this is the 'Overall quality' section, which includes an information icon and the text 'Add more projects to this team to co'. A summary card displays 'Grade A' with a green circle and 'Issues 0%' with a blue circle. At the bottom, a bar chart shows a blue bar reaching the 'A' grade level, with a dashed line indicating the target and a grey bar representing 'Open so'.

src/data_conn.c

Check buffer boundaries if used in a loop including recursive loops (CWE-120, CWE-20).

```
523 rc = read(data_eventfd, &value, sizeof (value));
```

src/istgt_integration_test.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
1172 if (i == strlen(ends)) {
```

src/istgt_lu.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
150 p = netmask + strlen(netmask);
```

Continuous Code Quality

Log in Read documentation

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`' .

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

Connect to Kubernetes cluster via kubectl (Use Cloud Shell)

1. Download the latest kubectl client from the [Kubernetes Edition page](#) .
2. Install and set up the kubectl client. For more information, see [Installing and Setting Up kubectl](#)
3. Configure the cluster credentials:

KubeConfig (Public Access)

Copy the following content to your local machine \$HOME/.kube/config

```
apiVersion: v1
clusters:
- cluster:
  server: https://cc04f5cd0bfa444d1b2a30b0548e09217.serverlessk8s-a.cn-
```

Copy

Select Cluster Template

Managed Clusters

Standard Managed Cluster

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

Create

Managed GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

Create

Elastic Bare Metal Cluster

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

Create

Windows Cluster (Beta)

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

Create

Other Clusters

Standard Dedicated

Cluster

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

Create

Dedicated GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

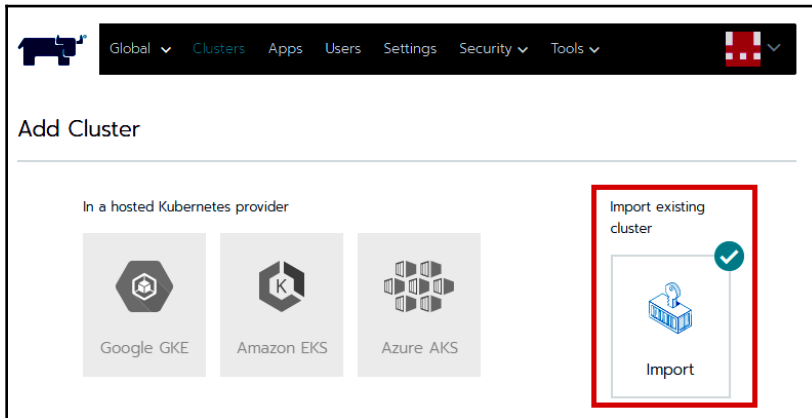

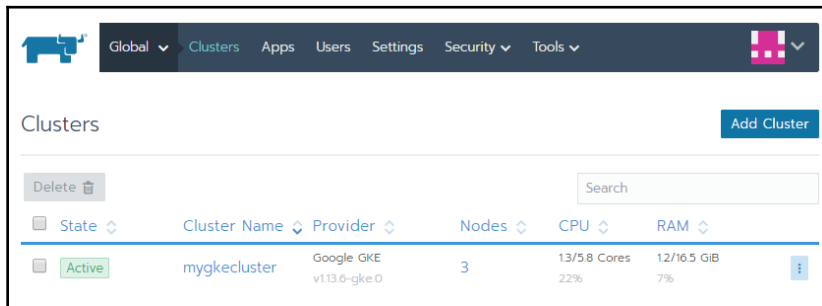

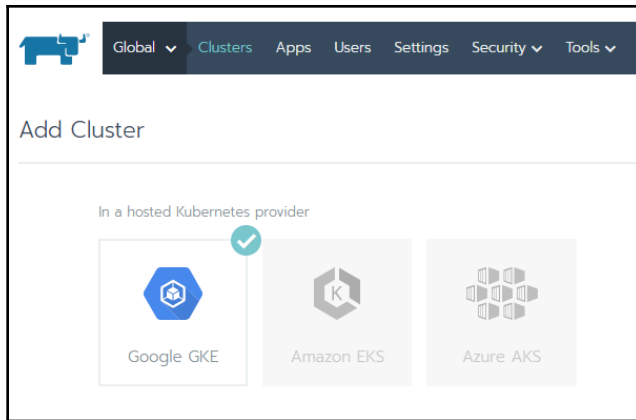

Create

Standard Serverless

Cluster

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

Create

```
curl --insecure -sfl
https://54.184.9.87/v3/import/5nvrfeh6x66xgqfj5nh5ghwt1lvhf9v6gwbnj7qb69jtp19v8c2bn.yaml

Cloud Build

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

Description

The screenshot shows a dashboard for 'K8sDevOpsCookbook'. On the left is a navigation sidebar with icons for Team, Personal, Projects, and Settings. The main content area has a header 'K8sDevOpsCookbook' with a dropdown for 'All teams'. Below this is the 'Overall quality' section, which includes a message: 'Add more projects to this team to co'. The quality metrics are displayed as follows:

Metric	Value
Grade	A
Issues	0%

Below the metrics is a bar chart with a blue bar reaching the 'A' grade level. A dashed horizontal line is drawn at the top of the 'A' grade. The text 'Open so' is partially visible on the right side of the chart area.

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

- GitHub
- SCM
- Security
- Technical Debt

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`' .

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

Connect to Kubernetes cluster via kubectl (Use Cloud Shell)

1. Download the latest kubectl client from the [Kubernetes Edition page](#) .
2. Install and set up the kubectl client. For more information, see [Installing and Setting Up kubectl](#)
3. Configure the cluster credentials:

KubeConfig (Public Access)

Copy the following content to your local machine \$HOME/.kube/config

```
apiVersion: v1
clusters:
- cluster:
  server: https://cc04f5cd0bfa444d1b2a30b0548e09217.serverlessk8s-a.cn-
```

Copy

Select Cluster Template

Managed Clusters

Standard Managed Cluster

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

Create

Managed GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

Create

Elastic Bare Metal Cluster

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

Create

Windows Cluster (Beta)

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

Create

Other Clusters

Standard Dedicated

Cluster

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

Create

Dedicated GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

Create

Standard Serverless

Cluster

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

Create

```
curl --insecure -sfl
https://54.184.9.87/v3/import/5nvrch6x66xgqfj5nh5ghwt1lvhf9v6gwbnj7qb69jtp19v8c2bn.yaml

The image shows the GitLab welcome dashboard. At the top, there is a navigation bar with 'GitLab' and several dropdown menus. Below the navigation bar, the main heading is 'Welcome to GitLab' with the tagline 'Code, test, and deploy together'. The dashboard is divided into four main sections, each with an icon and a title:

- Create a project:** Projects are where you store your code, access issues, wiki and other features of GitLab.
- Create a group:** Groups are a great way to organize projects and people.
- Add people:** Add your team members and others to GitLab.
- Configure GitLab:** Make adjustments to how your GitLab instance is set up.

The image shows the Jenkins Pipelines Administration page. The top navigation bar includes 'Jenkins', 'Pipelines', and 'Administration'. Below the navigation bar, there is a search bar for pipelines and a 'New Pipeline' button. The main content area displays a table of pipelines with the following data:

NAME	HEALTH	BRANCHES	PR

1 ****0.1.35****
 2 > Upgrade note:
 3 * Due to the change in default access mode, existing users will have to specify `ReadWriteMany` as the access mode. For example:
 4 ```
 5 gitlabDataAccessMode=ReadWriteMany
 6 gitlabRegistryAccessMode=ReadWriteMany
 7 gitlabConfigAccessMode=ReadWriteMany
 8 ```
 9
 10 * Sets the default access mode for `gitlab-storage`, `gitlab-registry-storage`, and `gitlab-config-storage` to be
 11 `ReadWriteOnce` to be compatible with Kubernetes 1.7.0+.
 12 * The parameter name to configure the size of the `gitlab-storage` PVC
 13 has changed from `gitlabRailsStorageSize` to `gitlabDataStorageSize`. For
 14 backwards compatability, `gitlabRailsStorageSize` will still apply
 15 provided `gitlabDataStorageSize` is undefined.ggdgd

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

Home / Generic Chaos

Generic Chaos ▾

Kubernetes is an open-source system for automating deployment, scaling, and management of containerized applications. It groups containers that make up an application into logical units for easy management and discovery. Install will all the experiments which can be used to inject chaos into containerized applications.

Continuous Code Quality

Log in Read documentation

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`' .

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

Select Cluster Template ✕

Managed Clusters

 **Standard Managed Cluster**

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

[Create](#)

 **Managed GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Elastic Bare Metal Cluster**

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

[Create](#)

 **Windows Cluster (Beta)**

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

[Create](#)

Other Clusters

 **Standard Dedicated Cluster**

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

[Create](#)

 **Dedicated GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Standard Serverless Cluster**

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

The image shows the GitLab welcome dashboard. At the top, there is a navigation bar with 'GitLab' logo, 'Projects', 'Groups', and 'More' dropdowns, along with a search bar and utility icons. The main content area is titled 'Welcome to GitLab' with the tagline 'Code, test, and deploy together'. Below this, there are four large, light-colored cards with icons and text:

- Create a project:** Projects are where you store your code, access issues, wiki and other features of GitLab.
- Create a group:** Groups are a great way to organize projects and people.
- Add people:** Add your team members and others to GitLab.
- Configure GitLab:** Make adjustments to how your GitLab instance is set up.

The image shows the Jenkins Pipelines Administration page. The top navigation bar includes 'Jenkins', 'Pipelines', and 'Administration' tabs, a 'Logout' button, and a search bar for pipelines. Below the navigation, there is a 'New Pipeline' button and a table listing existing pipelines.

2  > Upgrade note:
3  * Due to the change in default access mode, existing users will have to specify `ReadWriteMany` as the access mode. For example:
4  ...
5  gitlabDataAccessMode=ReadWriteMany
6  gitlabRegistryAccessMode=ReadWriteMany
7  gitlabConfigAccessMode=ReadWriteMany
8  ...
9
10 * Sets the default access mode for `gitlab-storage`, `gitlab-registry-storage`, and `gitlab-config-storage` to be
11 `ReadWriteOnce` to be compatible with Kubernetes 1.7.0+.
12 * The parameter name to configure the size of the `gitlab-storage` PVC
13 has changed from `gitlabRailsStorageSize` to `gitlabDataStorageSize`. For
14 backwards compatability, `gitlabRailsStorageSize` will still apply
15 provided `gitlabDataStorageSize` is undefined.ggdgd

Generate

Git credentials generated ✕

IAM has generated a user name and password for you to use when authenticating to AWS CodeCommit. You can use these credentials when connecting to AWS CodeCommit from your local computer and from tools that require a static user name and password. [Learn more](#)

User name muratkarslioglu-at-316621595114

Password ***** [Show](#)

This is the only time the password will be available to view, copy, or download. We recommend downloading these credentials and storing the file in a secure location. You can reset the password in IAM at any time.

[Download credentials](#) [Close](#)

The screenshot shows the AWS console navigation menu. At the top, there is the AWS logo, a 'Services' dropdown menu, and a 'Resources' link. Below this, the 'Developer Tools' section is expanded, showing a list of services. 'CodeBuild' is selected and highlighted. Under 'CodeBuild', there are several options: 'Source • CodeCommit', 'Build • CodeBuild' (which is expanded), 'Getting started', 'Build projects' (highlighted in orange), 'Build history', and 'Account metrics'.

The screenshot shows the 'Build projects' page in the AWS console. The breadcrumb navigation at the top reads 'Developer Tools > CodeBuild > Build projects'. Below the breadcrumb, there is a search bar with a magnifying glass icon. To the right of the search bar are several buttons: 'Start build', 'View details', 'Edit' (with a dropdown arrow), 'Delete', and 'Create build project' (highlighted in orange). At the bottom right, there are navigation arrows and the number '1'.

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

src/data_conn.c

Check buffer boundaries if used in a loop including recursive loops (CWE-120, CWE-20).

```
523 rc = read(data_eventfd, &value, sizeof (value));
```

src/istgt_integration_test.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
1172 if (i == strlen(ends)) {
```

src/istgt_lu.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
150 p = netmask + strlen(netmask);
```

Continuous Code Quality

Log in Read documentation

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

- Technical Debt

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`'.

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

The screenshot shows the top portion of the Kasten interface. At the top left is the Kasten logo. Below it is a card titled "Applications" with the subtitle "Discovered in this system". A large number "4" is displayed prominently. Below the number are three buttons: "0 Compliant", "0 Non-Compliant", and "4 Unmanaged".

The screenshot shows the main "Applications" dashboard. At the top left is the Kasten logo, and at the top right is a "Settings" link. Below the logo is a "Dashboard" link. The main heading is "Applications" with the subtitle "View details or perform actions on applications." Below this is a filter bar with an "Unmanaged" filter selected, a "Filter by name" input field, and a "4 applications" count. Below the filter bar are two application cards. The first card is titled "backup-example" and the second is titled "default". Both cards have a status of "Not protected by any policies" and a "Create a policy" button. Each card also has a dropdown menu and a gear icon with the number "1" next to it.

Connect to Kubernetes cluster via kubectl (Use Cloud Shell)

1. Download the latest kubectl client from the [Kubernetes Edition page](#) .
2. Install and set up the kubectl client. For more information, see [Installing and Setting Up kubectl](#)
3. Configure the cluster credentials:

KubeConfig (Public Access)

Copy the following content to your local machine \$HOME/.kube/config

```
apiVersion: v1
clusters:
- cluster:
  server: https://cc04f5cd0bfa444d1b2a30b0548e09217.serverlessk8s-a.cn-
```

Copy

Select Cluster Template ✕

Managed Clusters

 **Standard Managed Cluster**

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

[Create](#)

 **Managed GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Elastic Bare Metal Cluster**

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

[Create](#)

 **Windows Cluster (Beta)**

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

[Create](#)

Other Clusters

 **Standard Dedicated Cluster**

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

[Create](#)

 **Dedicated GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Standard Serverless Cluster**

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

The image shows the GitLab 'Welcome to GitLab' dashboard. At the top, there is a navigation bar with 'Projects', 'Groups', and 'More' dropdown menus, along with a search bar and utility icons. The main content area is titled 'Welcome to GitLab' with the tagline 'Code, test, and deploy together'. Below this, there are four large, light-colored cards with rounded corners, each featuring a circular icon and a title:

- Create a project**: Projects are where you store your code, access issues, wiki and other features of GitLab.
- Create a group**: Groups are a great way to organize projects and people.
- Add people**: Add your team members and others to GitLab.
- Configure GitLab**: Make adjustments to how your GitLab instance is set up.

The image shows the Jenkins 'Administration' page for Pipelines. The top navigation bar includes 'Jenkins', 'Pipelines', 'Administration', a home icon, and a 'Logout' button. Below the navigation, there is a 'Pipelines' section with a search bar and a 'New Pipeline' button. The main content area contains a table with the following data:

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

Home / Generic Chaos

Generic Chaos ▾

Kubernetes is an open-source system for automating deployment, scaling, and management of containerized applications. It groups containers that make up an application into logical units for easy management and discovery. Install will all the experiments which can be used to inject chaos into containerized applications.

INSTALL ALL EXPERIMENTS

Generic Chaos
Contributed by Mayadata

Install the Chaos Experiments

You can install the Chaos Experiments by following command

```
kubect1 create -f https://hub.litmuschaos.io/api/chaos?file=charts/generic/experiments.yaml
```

Notes:
[Install Litmus Operator](#), a tool for for injecting chaos experiments on Kubernetes

src/data_conn.c

Check buffer boundaries if used in a loop including recursive loops (CWE-120, CWE-20).

```
523 rc = read(data_eventfd, &value, sizeof (value));
```

src/istgt_integration_test.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
1172 if (i == strlen(ends)) {
```

src/istgt_lu.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
150 p = netmask + strlen(netmask);
```

Continuous Code Quality

Log in Read documentation

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

- Technical Debt

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`' .

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

Restore application *backup-example*

Restore an application to a previous state. Restore points are shown and ordered based on scheduled execution time which may be different from the actual creation time. During a restore, the existing application is deleted and then recreated with the data artifacts restored from backups.

Select a restore point for details.

Past day

Role ARN

Description of account

When you add an AWS account, a Google Cloud Platform project will be created to store your AWS monitoring and logging data.

AWS Data Collection may take a few minutes to start.

Get Reports by Email

Stackdriver can send you reports on the performance of your cloud applications by email. Reports include information on incidents and utilization.

Select the frequency of reports that you would like to receive. You can change this setting any time in your Workspace Settings.

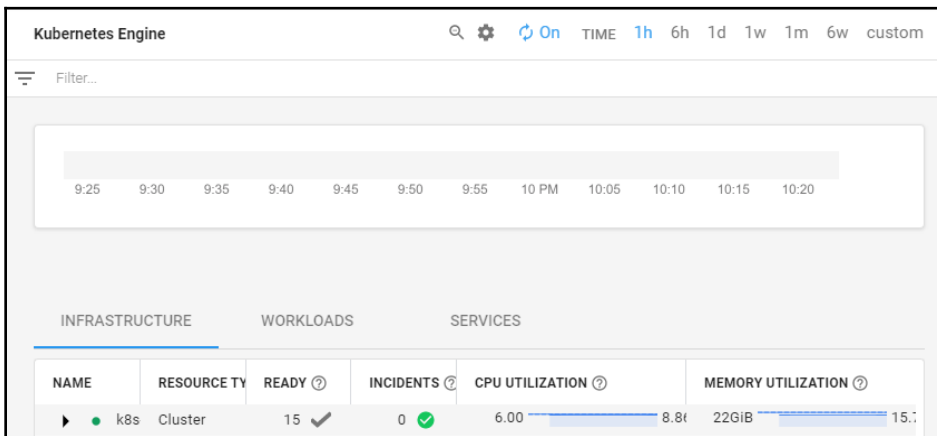

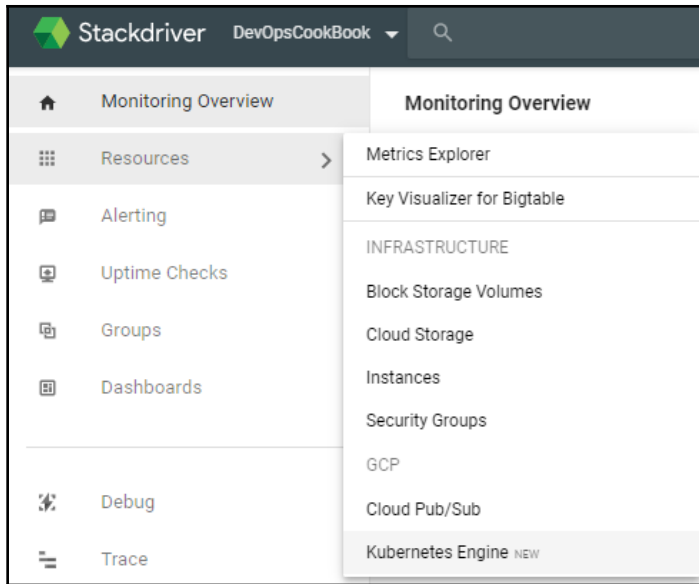

- Daily reports, including weekly summaries
- Weekly reports
- No reports

Continue

Finished initial collection!

Launch monitoring

The screenshot shows the Stackdriver Monitoring Overview page. The top navigation bar includes the Stackdriver logo, the text 'DevOpsCookBook', a search icon, and a user profile for 'Murat'. The left sidebar contains a menu with items: Monitoring Overview (selected), Resources, Alerting, Uptime Checks, Groups, Dashboards, Debug, Trace, Logging, and Error Reporting. The main content area is titled 'Monitoring Overview' and features a 'Welcome to Stackdriver Monitoring!' message. Below the message is a checklist to get started, with three main items: 'Install Stackdriver agents' (with a download icon), 'Create uptime checks' (with a checkmark icon), and 'Create alerting policies' (with a speech bubble icon). Each item has a brief description and a corresponding action button: 'INSTALL AGENTS', 'CREATE CHECK', and 'CREATE POLICY'. There are also links for 'Add GCP Projects', 'Email Reports', and 'Tutorials'.

The screenshot shows a detailed view of the 'Kubernetes Engine' resources. The 'INFRASTRUCTURE' tab is selected. The table displays the following data:

Jenkins: Performance and health overview by lubovarganike

DASHBOARD

Jobs queue speeds and rates, Executors availability, Nodes status, Jenkins and JVM resource usage.

Created as copy of a bit nicer dashboard, which is using graphite datasource.

Last updated: 3 years ago

Add your review!

Overview

Revisions

Reviews

Just install <https://wiki.jenkins-ci.org/display/JENKINS/Prometheus+Plugin> plugin for jenkins, start monitoring it by your prometheus and then use this dashboard.

NOTE: Dashboard is prepared to handle only single instance of monitored jenkins on single datasource. Should be improved by a bit templating magic.

Integrate with AWS

Ready to go

LOGOUT

Integrate with AWS

Sysdig Monitor offers deep integration with AWS, allowing you to monitor services such as EC2, ELB and RDS within Sysdig Monitor, and also pull your tags and other AWS metadata.

To enable the integration, you just need to provide Sysdig Monitor with read-only access to your account. See [here for specific instructions](#) on how to generate the necessary Keys.

Access Key ID:

Secret Access Key:

CloudWatch Integration Status

Disabled Enabled

Note: Once you provide the necessary keys, CloudWatch integration will be enabled by default. When this feature is enabled, Sysdig Monitor will poll the CloudWatch API every 5 minutes, which will generate a small additional charge from AWS (see [Amazon CloudWatch Pricing](#)).

You're not using a cloud provider? Don't worry, Sysdig Monitor will still work well for your infrastructure.

BACK SKIP **NEXT**

Welcome

Set Up Environment

Integrate with AWS

Ready to go

[LOGOUT](#)

Congrats! Setup is complete.

To add team members to your Sysdig Monitor account, just head over to the Users tab in Settings.

For additional documentation and videos you can access the Help by clicking the  button at the bottom left corner of the app.

We hope you enjoy the unique insight and visibility provided by Sysdig Monitor. Now go check it out!

Select Cluster Template ✕

Managed Clusters

 **Standard Managed Cluster**

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

[Create](#)

 **Managed GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Elastic Bare Metal Cluster**

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

[Create](#)

 **Windows Cluster (Beta)**

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

[Create](#)

Other Clusters

 **Standard Dedicated Cluster**

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

[Create](#)

 **Dedicated GPU Cluster**

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

[Create](#)

 **Standard Serverless Cluster**

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

The image shows the GitLab welcome page. At the top, there is a navigation bar with 'GitLab' logo, 'Projects', 'Groups', and 'More' dropdowns, along with a search bar and utility icons. The main content area is titled 'Welcome to GitLab' with the tagline 'Code, test, and deploy together'. Below this, there are four large white cards with rounded corners, each containing an icon and a title: 'Create a project' (with a document icon), 'Create a group' (with a group of people icon), 'Add people' (with a person icon), and 'Configure GitLab' (with a gear icon). Each card has a short descriptive paragraph below the title.

The image shows the Jenkins Pipelines page. The top navigation bar includes 'Jenkins' logo, 'Pipelines' (active), and 'Administration' tabs, along with a 'Logout' button. Below the navigation, there is a search bar for pipelines and a 'New Pipeline' button. The main area contains a table with the following data:

Welcome to GitLab

Code, test, and deploy together

Create a project

Projects are where you store your code, access issues, wiki and other features of GitLab.

Create a group

Groups are a great way to organize projects and people.

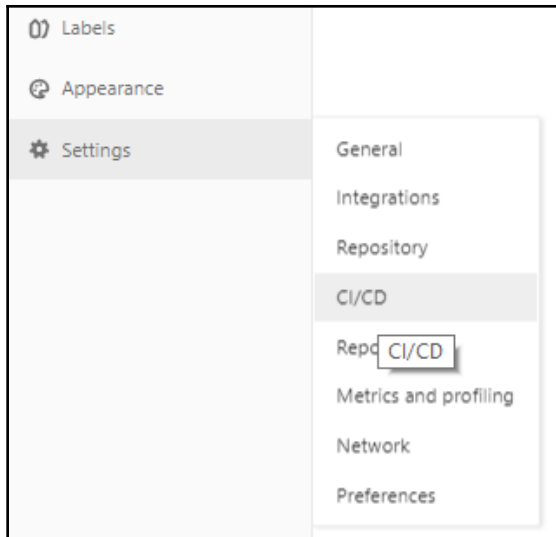

Add people

Add your team members and others to GitLab.

Configure GitLab

Make adjustments to how your GitLab instance is set up.

Integrate Kubernetes cluster automation

Kubernetes clusters allow you to use review apps, deploy your applications, run your pipelines, and much more in an easy way. Adding an integration will share the cluster across all projects. [Learn more about instance Kubernetes clusters](#)

[Add Kubernetes cluster](#)

Applications

Choose which applications to install on your Kubernetes cluster. Helm Tiller is required to install any of the following applications. [More information](#)

Helm Tiller

Helm streamlines installing and managing Kubernetes applications. Tiller runs inside of your Kubernetes Cluster, and manages releases of your charts.

Install

You must first install Helm Tiller before installing the applications below

```

1  **0.1.35**
2  > Upgrade note:
3  * Due to the change in default access mode, existing users will have to specify `ReadWriteMany` as the access mode. For example:
4  ...
5  gitlabDataAccessMode=ReadWriteMany
6  gitlabRegistryAccessMode=ReadWriteMany
7  gitlabConfigAccessMode=ReadWriteMany
8  ...
9
10 * Sets the default access mode for `gitlab-storage`, `gitlab-registry-storage`, and `gitlab-config-storage` to be
11 `ReadWriteOnce` to be compatible with Kubernetes 1.7.0+.
12 * The parameter name to configure the size of the `gitlab-storage` PVC
13 has changed from `gitlabRailsStorageSize` to `gitlabDataStorageSize`. For
14 backwards compatibility, `gitlabRailsStorageSize` will still apply
15 provided `gitlabDataStorageSize` is undefined.ggdgd

Cloud Build

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

src/data_conn.c

Check buffer boundaries if used in a loop including recursive loops (CWE-120, CWE-20).

```
523 rc = read(data_eventfd, &value, sizeof (value));
```

src/istgt_integration_test.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
1172 if (i == strlen(ends)) {
```

src/istgt_lu.c

Does not handle strings that are not \0-terminated; if given one it may perform an over-read (it could cause a crash if unprotected) (CWE-126).

```
150 p = netmask + strlen(netmask);
```

Continuous Code Quality

Log in Read documentation

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

General Settings

Edit global settings for this SonarQube instance.

- Analysis Scope
- General
- GitHub
- SCM
- Security
- Technical Debt

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`' .

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

Select a Google Cloud Platform project to store your workspace settings and user permissions. The selection cannot be changed, but you can create other Workspaces later. [Learn more](#)

Google Cloud Platform project

- DevOpsCookBook
- devopscookbook

Role ARN

Description of account

When you add an AWS account, a Google Cloud Platform project will be created to store your AWS monitoring and logging data.

AWS Data Collection may take a few minutes to start.

Add AWS account

Skip AWS Setup

Get Reports by Email

Stackdriver can send you reports on the performance of your cloud applications by email. Reports include information on incidents and utilization.

Select the frequency of reports that you would like to receive. You can change this setting any time in your Workspace Settings.

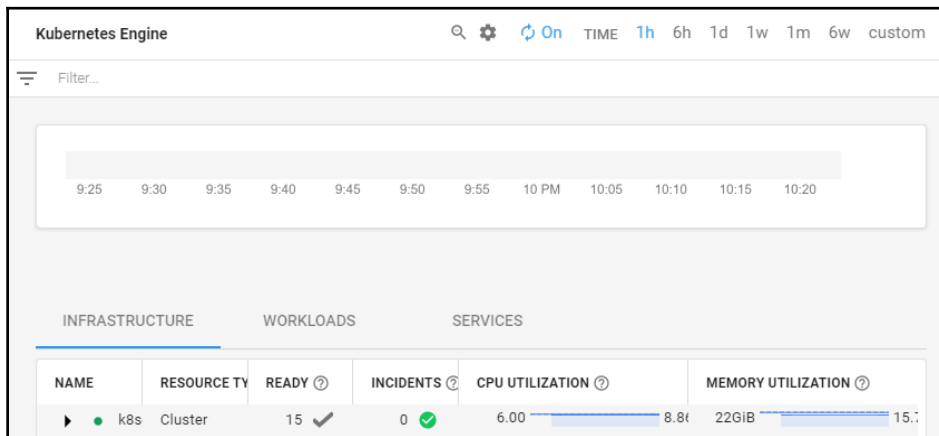

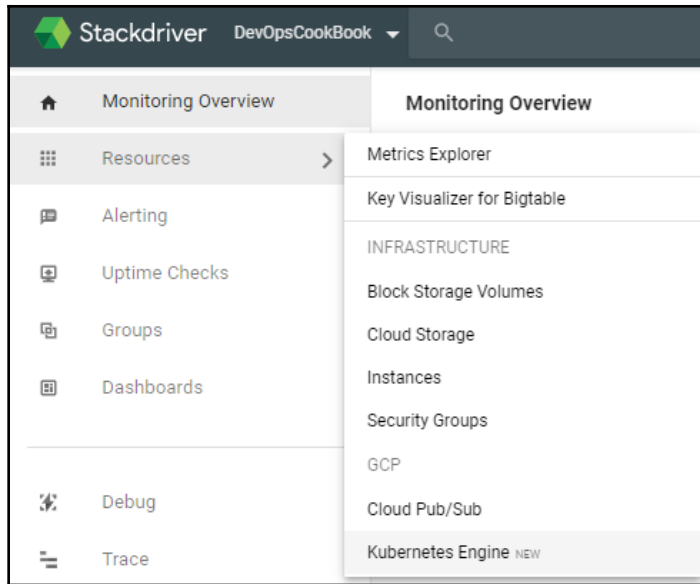

- Daily reports, including weekly summaries
- Weekly reports
- No reports

Continue

Finished initial collection!

Launch monitoring

The screenshot shows the Stackdriver Monitoring Overview page. The top navigation bar includes the Stackdriver logo, the workspace name 'DevOpsCookBook', a search icon, and the user profile 'Murat'. The left sidebar contains a navigation menu with items: Monitoring Overview (selected), Resources, Alerting, Uptime Checks, Groups, Dashboards, Debug, Trace, Logging, and Error Reporting. The main content area is titled 'Monitoring Overview' and features a 'Welcome to Stackdriver Monitoring!' message. Below the message, there are three primary actions: 'Install Stackdriver agents' (with a download icon), 'Create uptime checks' (with a check icon), and 'Create alerting policies' (with a message icon). Each action includes a brief description and a corresponding button: 'INSTALL AGENTS', 'CREATE CHECK', and 'CREATE POLICY'. At the top right of the main content area, there are utility icons for search, settings, full screen, refresh, and status (Off), along with 'TIME (1H)' and 'custom' options.

The screenshot shows a detailed view of the 'Kubernetes Engine' monitoring page, focusing on the 'INFRASTRUCTURE' tab. The table displays the following data:

Jenkins: Performance and health overview

DASHBOARD

Jobs queue speeds and rates, Executors availability, Nodes status, Jenkins and JVM resource usage.

Created as copy of a bit nicer dashboard, which is using graphite datasource.

Last updated: 3 years ago

Overview

Revisions

Reviews

Just install <https://wiki.jenkins-ci.org/display/JENKINS/Prometheus+Plugin> plugin for jenkins, start monitoring it by your prometheus and than use this dashboard.

NOTE: Dashboard is prepared to handle only single instance of monitored jenkins on single datasource. Should be improved by a bit templating magic.

LOGOUT

Integrate with AWS

Sysdig Monitor offers deep integration with AWS, allowing you to monitor services such as EC2, ELB and RDS within Sysdig Monitor, and also pull your tags and other AWS metadata.

To enable the integration, you just need to provide Sysdig Monitor with read-only access to your account. See [here for specific instructions](#) on how to generate the necessary Keys.

Access Key ID:

Secret Access Key:

CloudWatch Integration Status

Disabled Enabled

Note: Once you provide the necessary keys, CloudWatch integration will be enabled by default. When this feature is enabled, Sysdig Monitor will poll the CloudWatch API every 5 minutes, which will generate a small additional charge from AWS (see [Amazon CloudWatch Pricing](#)).

You're not using a cloud provider? Don't worry, Sysdig Monitor will still work well for your infrastructure.

BACK SKIP **NEXT**

```

Copy

Select Cluster Template

Managed Clusters

Standard Managed Cluster

In full managed Kubernetes clusters, you only need to manage your worker nodes. And it can save your cost of resource and operation for master nodes.

Create

Managed GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

Create

Elastic Bare Metal Cluster

This type of cluster uses Elastic Bare Metal instances as worker nodes, which provide an elastic high-performance cluster which are suitable for CPU and network intensive applications.

Create

Windows Cluster (Beta)

This type of cluster supports Windows containers and allows mixing Linux and Windows nodes.

Create

Other Clusters

Standard Dedicated

Cluster

This type of cluster allows you to create master nodes and worker nodes based on your needs. You have full control of the cluster.

Create

Dedicated GPU Cluster

This type of cluster uses GPU instances as worker nodes, which are suitable for compute-intensive applications, such as AI, deep learning, and image rendering applications.

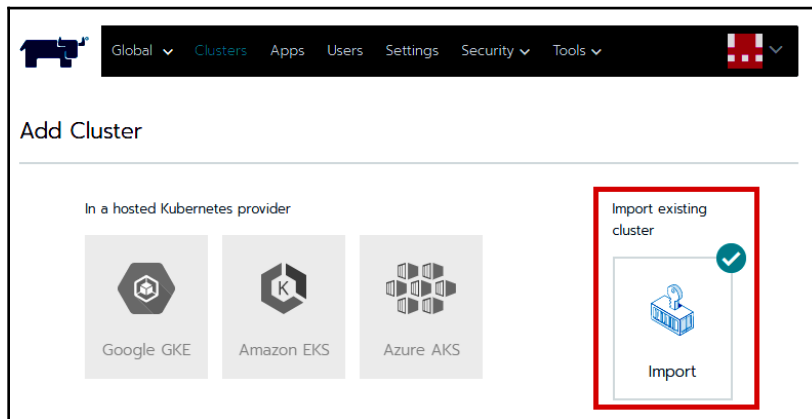

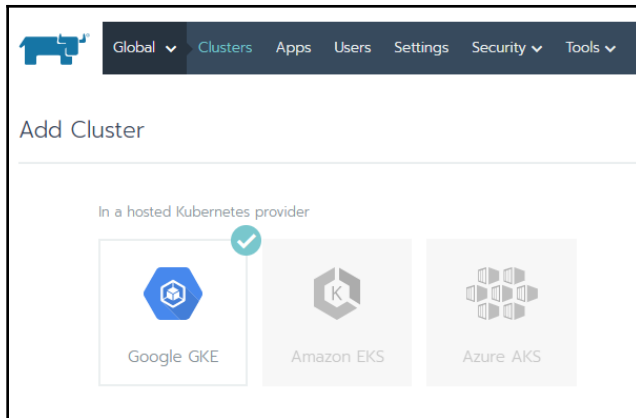

Create

Standard Serverless

Cluster

This type of cluster allows you to deploy containers without managing nodes. You only pay for the resources used by application.

Create

```
curl --insecure -sfl
https://54.184.9.87/v3/import/5nvrch6x66xgqfj5nh5ghwt1lvhf9v6gwwbnj7qb69jtp19v8c2bn.yaml

The image shows the GitLab welcome page. At the top, there is a navigation bar with 'GitLab' and several dropdown menus. Below the navigation bar, the main heading is 'Welcome to GitLab' with the tagline 'Code, test, and deploy together'. The page features four main action cards: 'Create a project', 'Create a group', 'Add people', and 'Configure GitLab', each with an icon and a brief description.

The image shows the Jenkins Pipelines page. The top navigation bar includes 'Jenkins', 'Pipelines', and 'Administration'. Below the navigation bar, there is a search bar for pipelines and a 'New Pipeline' button. The main content area displays a table of pipelines with columns for NAME, HEALTH, BRANCHES, and PR.

Welcome to GitLab

Code, test, and deploy together

Create a project

Projects are where you store your code, access issues, wiki and other features of GitLab.

Create a group

Groups are a great way to organize projects and people.

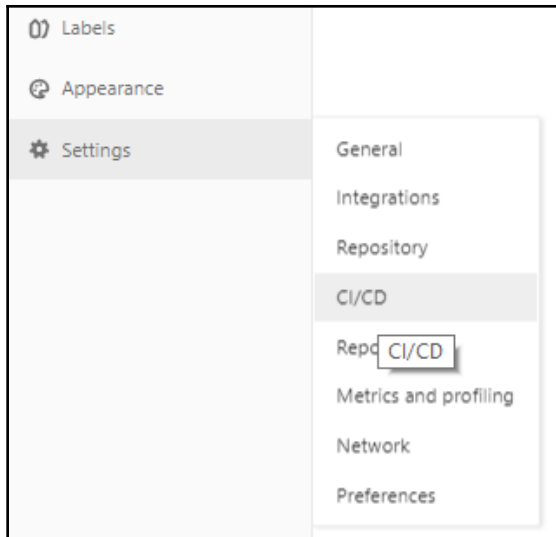

Add people

Add your team members and others to GitLab.

Configure GitLab

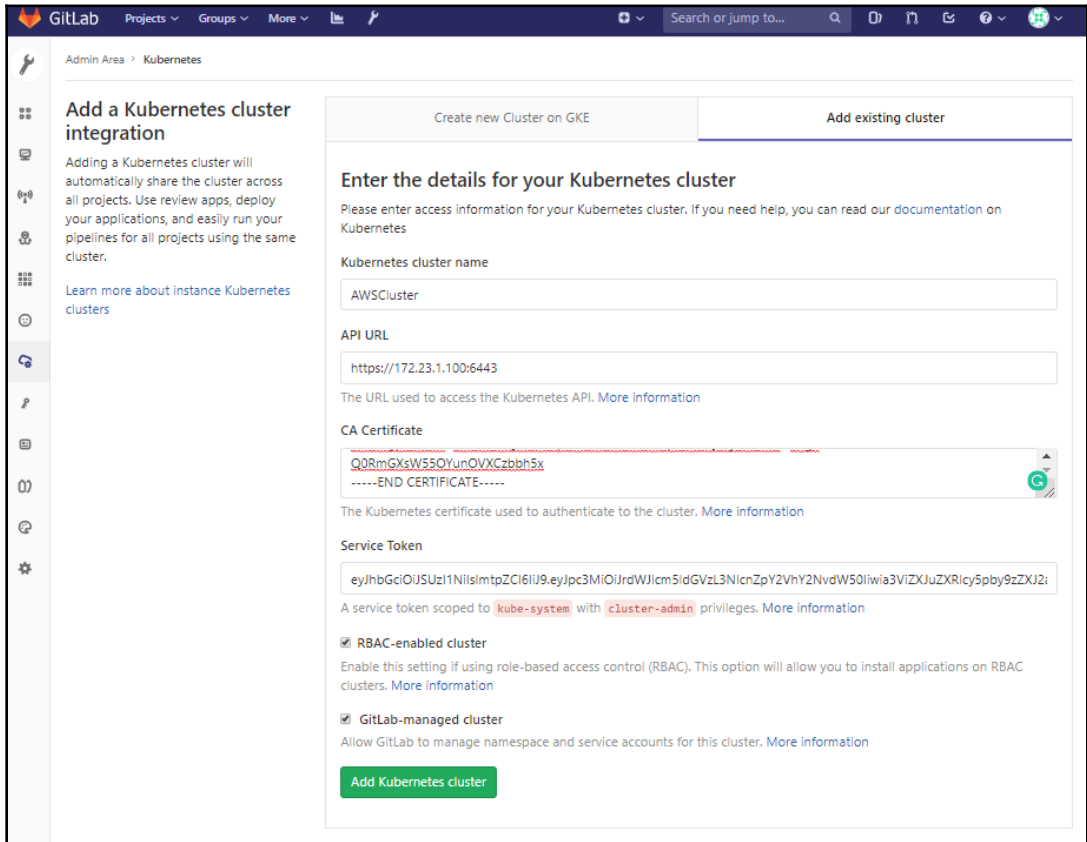

Make adjustments to how your GitLab instance is set up.

Integrate Kubernetes cluster automation

Kubernetes clusters allow you to use review apps, deploy your applications, run your pipelines, and much more in an easy way. Adding an integration will share the cluster across all projects. [Learn more about instance Kubernetes clusters](#)

[Add Kubernetes cluster](#)

Applications

Choose which applications to install on your Kubernetes cluster. Helm Tiller is required to install any of the following applications. [More information](#)

Helm Tiller

Helm streamlines installing and managing Kubernetes applications. Tiller runs inside of your Kubernetes Cluster, and manages releases of your charts.

Install

You must first install Helm Tiller before installing the applications below

Generate

Git credentials generated ✕

IAM has generated a user name and password for you to use when authenticating to AWS CodeCommit. You can use these credentials when connecting to AWS CodeCommit from your local computer and from tools that require a static user name and password. [Learn more](#)

User name muratkarslioglu-at-316621595114

Password ***** [Show](#)

This is the only time the password will be available to view, copy, or download. We recommend downloading these credentials and storing the file in a secure location. You can reset the password in IAM at any time.

[Download credentials](#) [Close](#)

The screenshot shows the AWS IAM console navigation menu. At the top, there is the AWS logo, a 'Services' dropdown menu, and a 'Resources' link. Below this, the 'Developer Tools' section is expanded, showing a list of services. 'CodeBuild' is highlighted in bold. Under 'CodeBuild', there are several options: 'Source • CodeCommit', 'Build • CodeBuild' (which is expanded), 'Getting started', 'Build projects' (highlighted in orange), 'Build history', and 'Account metrics'.

The screenshot shows the 'Build projects' page in the AWS IAM console. The breadcrumb navigation at the top reads 'Developer Tools > CodeBuild > Build projects'. Below the breadcrumb, the page title is 'Build projects'. There are five buttons: 'Start build', 'View details', 'Edit' (with a dropdown arrow), 'Delete', and 'Create build project' (highlighted in orange). Below the buttons is a search bar with a magnifying glass icon and a pagination control showing '< 1 >'.

Cloud Build

Build triggers

Make sure that the container images you build are up-to-date by creating a build trigger. A build trigger instructs Cloud Build to automatically build your image whenever there are changes pushed to the build source. You can set a build trigger to rebuild your images on any changes to the source repository, or only changes that match certain criteria. [Learn more](#)

Home / Generic Chaos

Generic Chaos ▾

Kubernetes is an open-source system for automating deployment, scaling, and management of containerized applications. It groups containers that make up an application into logical units for easy management and discovery. Install will all the experiments which can be used to inject chaos into containerized applications.

Description

The screenshot shows a dashboard for 'K8sDevOpsCookbook'. On the left is a navigation sidebar with icons for Team, Personal, Projects, and Settings. The main content area shows the team name 'K8sDevOpsCookbook' with a dropdown for 'All teams'. Below this is the 'Overall quality' section, which includes an information icon and the text 'Add more projects to this team to co'. A summary card displays a 'Grade' of 'A' in a green circle and 'Issues' at '0%'. At the bottom, a bar chart shows a blue bar reaching the 'A' grade level, with a dashed line indicating the target grade 'A' and a grey bar representing 'Open so'.

0 Projects Analyzed

- 0 Bugs
- 0 Vulnerabilities
- 0 Code Smells
- 0 Security Hotspots

Multi-Language

20+ programming languages are supported by SonarQube thanks to our in-house code analyzers, including:

Java	C/C++	C#	COBOL	ABAP	HTML	RPG	JavaScript	TypeScript	Objective C	XML
VB.NET	PL/SQL	T-SQL	Flex	Python	Groovy	PHP	Swift	Visual Basic	PL/I	

Quality Model

<p>Reliability</p> <p>Bugs track code that is demonstrably wrong or highly likely to yield unexpected behavior.</p>	<p>Security</p> <p>Vulnerabilities are raised on code that can be exploited by hackers.</p> <p>Security Hotspots are raised on security-</p>	<p>Maintainability</p> <p>Code Smells will confuse maintainers or give them pause. They are measured primarily in terms of the time they will take to fix.</p>

Quality Profiles

Create Restore

! There are no languages available. You cannot create a new profile.

Quality Profiles are collections of rules to apply during an analysis. For each language there is a default profile. All projects not explicitly assigned to some other profile will be analyzed with the default. Ideally, all projects will use the same profile for a language. [Learn More](#)

sonarqube Projects Issues Rules **Quality Profiles** Quality Gates Administration ?

Quality Profiles

Quality Profiles are collections of rules to apply during an analysis.
 For each language there is a default profile. All projects not explicitly assigned to some other profile will be analyzed with the default. Ideally, all projects will use the same profile for a language. [Learn More](#)

Java, 5 profile(s)	Projects ?	Rules	Updated	Used
FindBugs Built-in	0	443	12 minutes ago	Never
FindBugs + FB-Contrib Built-in	0	745	12 minutes ago	Never
FindBugs Security Audit Built-in	0	124	12 minutes ago	Never
FindBugs Security Minimal Built-in	0	94	12 minutes ago	Never

General Settings

Edit global settings for this SonarQube instance.

- Analysis Scope
- General
- GitHub
- SCM
- Security
- Technical Debt

Authentication

In order to enable GitHub authentication:

- SonarQube must be publicly accessible through HTTPS only
- The property 'sonar.core.serverBaseURL' must be set to this public HTTPS URL
- In your GitHub profile, you need to create a Developer Application for which the 'Authorization callback URL' must be set to '`<value_of_sonar.core.serverBaseURL_property>/oauth2/callback`'.

Enabled

Enable GitHub users to login. Value is ignored if client ID and secret are not defined.

Key: sonar.auth.github.enabled

[< Dashboard](#) [< Applications](#)

Restore application *backup-example*

Restore an application to a previous state. Restore points are shown and ordered based on scheduled execution time which may be different from the actual creation time. During a restore, the existing application is deleted and then recreated with the data artifacts restored from backups.

Select a restore point for details.

Past day

 **Today, 5:36am**

Google Cloud Platform project

- DevOpsCookBook
- devopscookbook

Role ARN

Description of account

When you add an AWS account, a Google Cloud Platform project will be created to store your AWS monitoring and logging data.

AWS Data Collection may take a few minutes to start.

Get Reports by Email

Stackdriver can send you reports on the performance of your cloud applications by email. Reports include information on incidents and utilization.

Select the frequency of reports that you would like to receive. You can change this setting any time in your Workspace Settings.

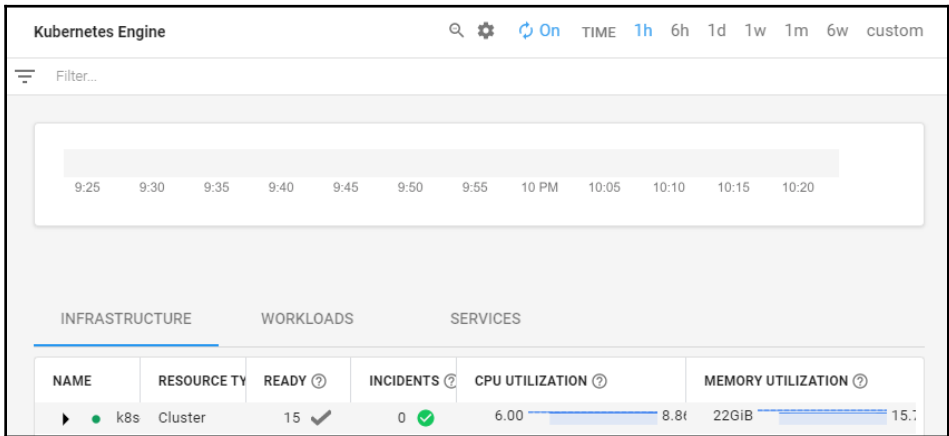

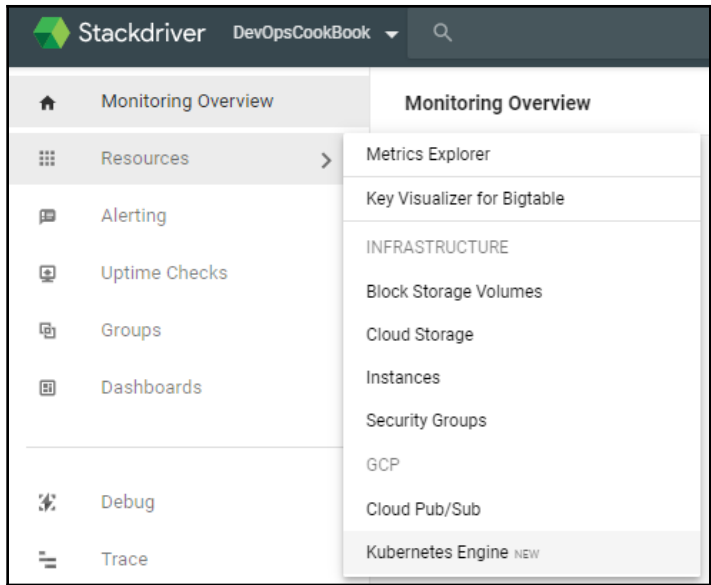

- Daily reports, including weekly summaries
- Weekly reports
- No reports

Finished initial collection!

Launch monitoring

The screenshot shows the Stackdriver Monitoring Overview page. The top navigation bar includes the Stackdriver logo, the text 'DevOpsCookBook', a search icon, and a user profile for 'Murat'. The left sidebar contains a menu with items: Monitoring Overview (selected), Resources, Alerting, Uptime Checks, Groups, Dashboards, Debug, Trace, Logging, and Error Reporting. The main content area is titled 'Monitoring Overview' and features a 'Welcome to Stackdriver Monitoring!' message. Below the message, there are three primary actions: 'Install Stackdriver agents' (with a download icon), 'Create uptime checks' (with a checkmark icon), and 'Create alerting policies' (with a speech bubble icon). Each action includes a brief description and a corresponding button: 'INSTALL AGENTS', 'CREATE CHECK', and 'CREATE POLICY'. At the top right of the main content area, there are icons for search, settings, full screen, refresh, and a status indicator 'Off', along with 'TIME (1H)' and 'custom' options.

This screenshot provides a detailed view of the 'INFRASTRUCTURE' tab. It shows a table with the following data:

DASHBOARD

Jobs queue speeds and rates, Executors availability, Nodes status, Jenkins and JVM resource usage.

Created as copy of a bit nicer dashboard, which is using graphite datasource.

Reviews

Just install <https://wiki.jenkins-ci.org/display/JENKINS/Prometheus+Plugin> plugin for jenkins, start monitoring it by your prometheus and then use this dashboard.

NOTE: Dashboard is prepared to handle only single instance of monitored jenkins on single datasource. Should be improved by a bit templating magic.

Get this dashboard:

Integrate with AWS

Sysdig Monitor offers deep integration with AWS, allowing you to monitor services such as EC2, ELB and RDS within Sysdig Monitor, and also pull your tags and other AWS metadata.

To enable the integration, you just need to provide Sysdig Monitor with read-only access to your account. See [here for specific instructions](#) on how to generate the necessary Keys.

Access Key ID:

Secret Access Key:

CloudWatch Integration Status

Disabled Enabled

Note: Once you provide the necessary keys, CloudWatch integration will be enabled by default. When this feature is enabled, Sysdig Monitor will poll the CloudWatch API every 5 minutes, which will generate a small additional charge from AWS (see [Amazon CloudWatch Pricing](#)).

You're not using a cloud provider? Don't worry, Sysdig Monitor will still work well for your infrastructure.

BACK SKIP **NEXT**

Welcome

Add Data to Kibana

Use these solutions to quickly turn your data into pre-built dashboards and monitoring systems.

APM

APM automatically collects in-depth performance metrics and errors from inside your applications.

[Add APM](#)

Logging

Ingest logs from popular data sources and easily visualize in preconfigured dashboards.

[Add log data](#)

Metrics

Collect metrics from the operating system and services running on your servers.

[Add metric data](#)

SIEM

Centralize security events for interactive investigation in ready-to-go visualizations.

[Add security events](#)

Add sample data

Load a data set and a Kibana dashboard

Upload data from log file

Import a CSV, NDJSON, or log file

Use Elasticsearch data

Connect to your Elasticsearch index

Management / Index patterns / Create index pattern

Elasticsearch

- Roles

Create index pattern

Kibana uses index patterns to retrieve data from Elasticsearch indices for things like visualizations. Include system indices

Step 1 of 2: Define index pattern

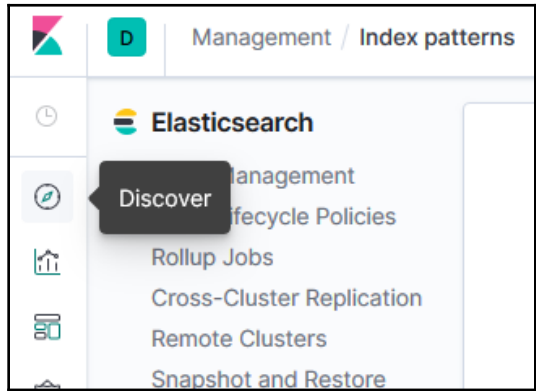

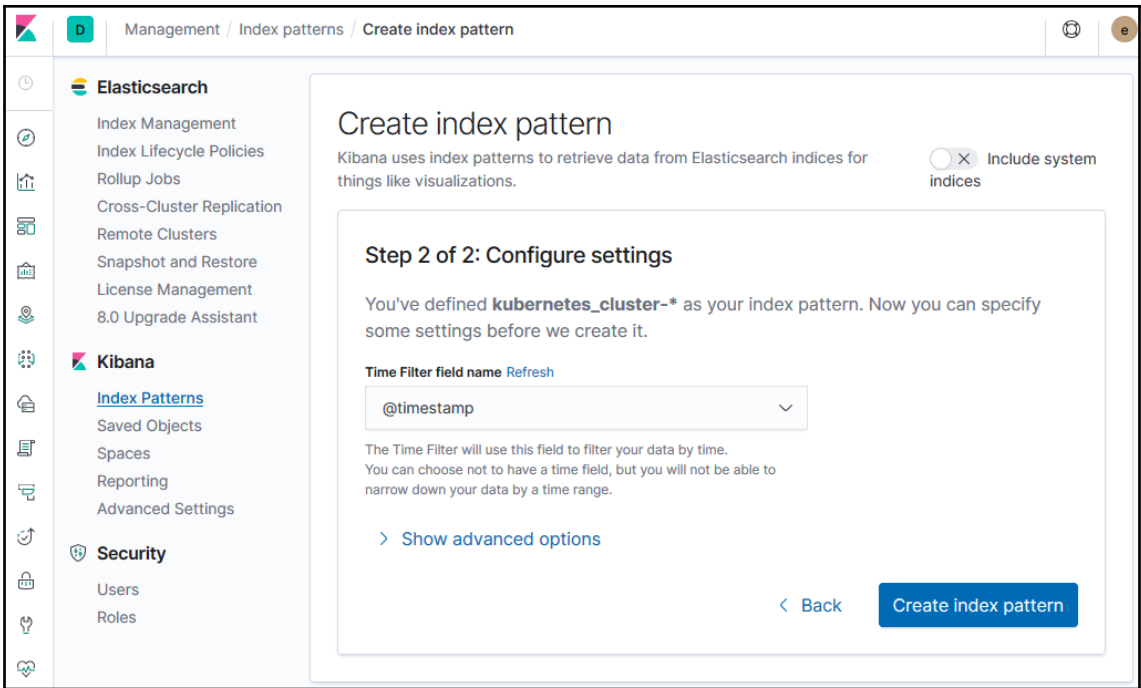

Index pattern

You can use a * as a wildcard in your index pattern.
You can't use spaces or the characters \, /, ?, ", <, >, |.

> Next step

✓ **Success!** Your index pattern matches **29 indices.**

The screenshot shows the Google Cloud Platform (GCP) Logs Explorer interface. At the top, the header includes the GCP logo, the user's profile 'DevOpsCookBook', and navigation icons. Below the header, there are buttons for 'CREATE METRIC', 'CREATE SINK', 'SAVE SEARCH', and 'SHOW LIBRARY'. The main content area features a search bar with the placeholder 'Filter by label or text search'. Below the search bar, there are filters for 'GCE Disk', 'All logs', 'Any log level', and 'Last hour'. A 'Jump to now' button is also present. The logs list shows 'Showing logs from the last hour ending at 11:03 AM (PST)'. The message 'No entries found matching current filter in the last hour.' is displayed in a yellow background, with 'Load older logs' and 'Load newer logs' buttons. The interface also includes 'Download logs' and 'View Options' links.

Manage Jenkins

Configure System

Configure global settings and paths.

Configure Global Security

Secure Jenkins; define who is allowed to access/use the system.

Configure Credentials

Configure the credential providers and types

Global Tool Configuration

Configure tools, their locations and automatic installers.

Reload Configuration from Disk

Discard all the loaded data in memory and reload everything from file system. Useful when you files directly on disk.

Manage Plugins

Add, remove and enable/disable plugins that can extend the functionality of Jenkins.
