Connect when the wizard completes

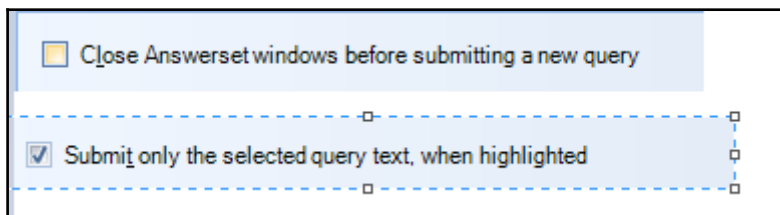

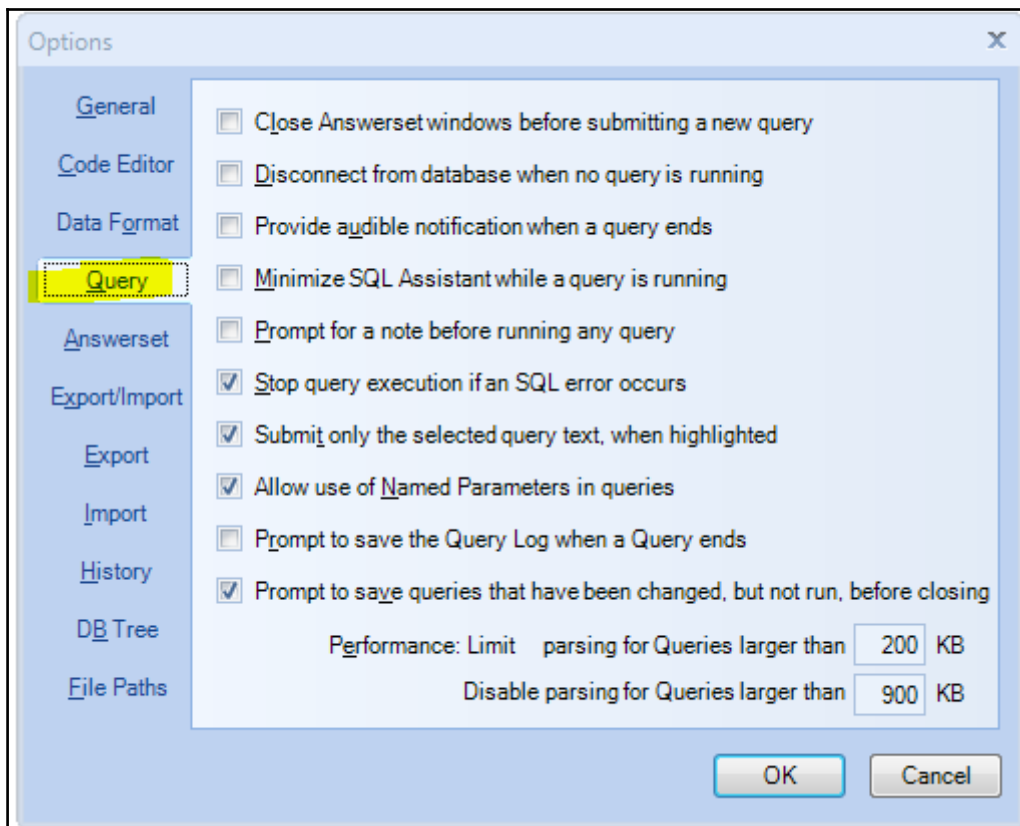

Connect every time the workbench is started

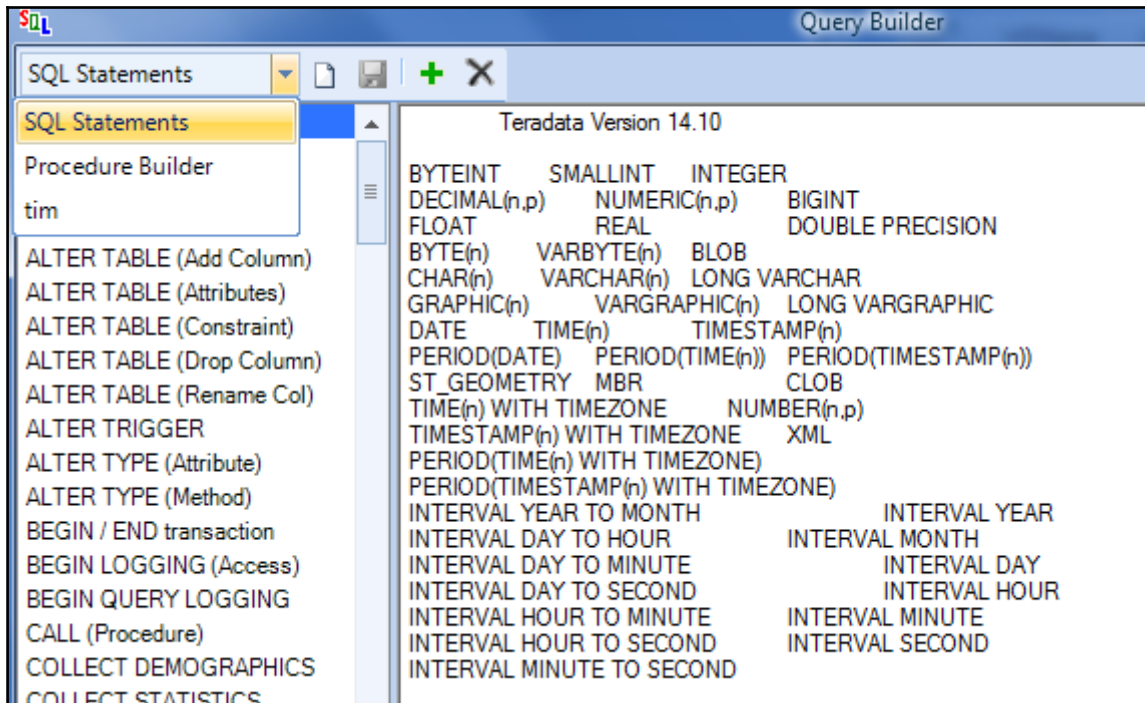

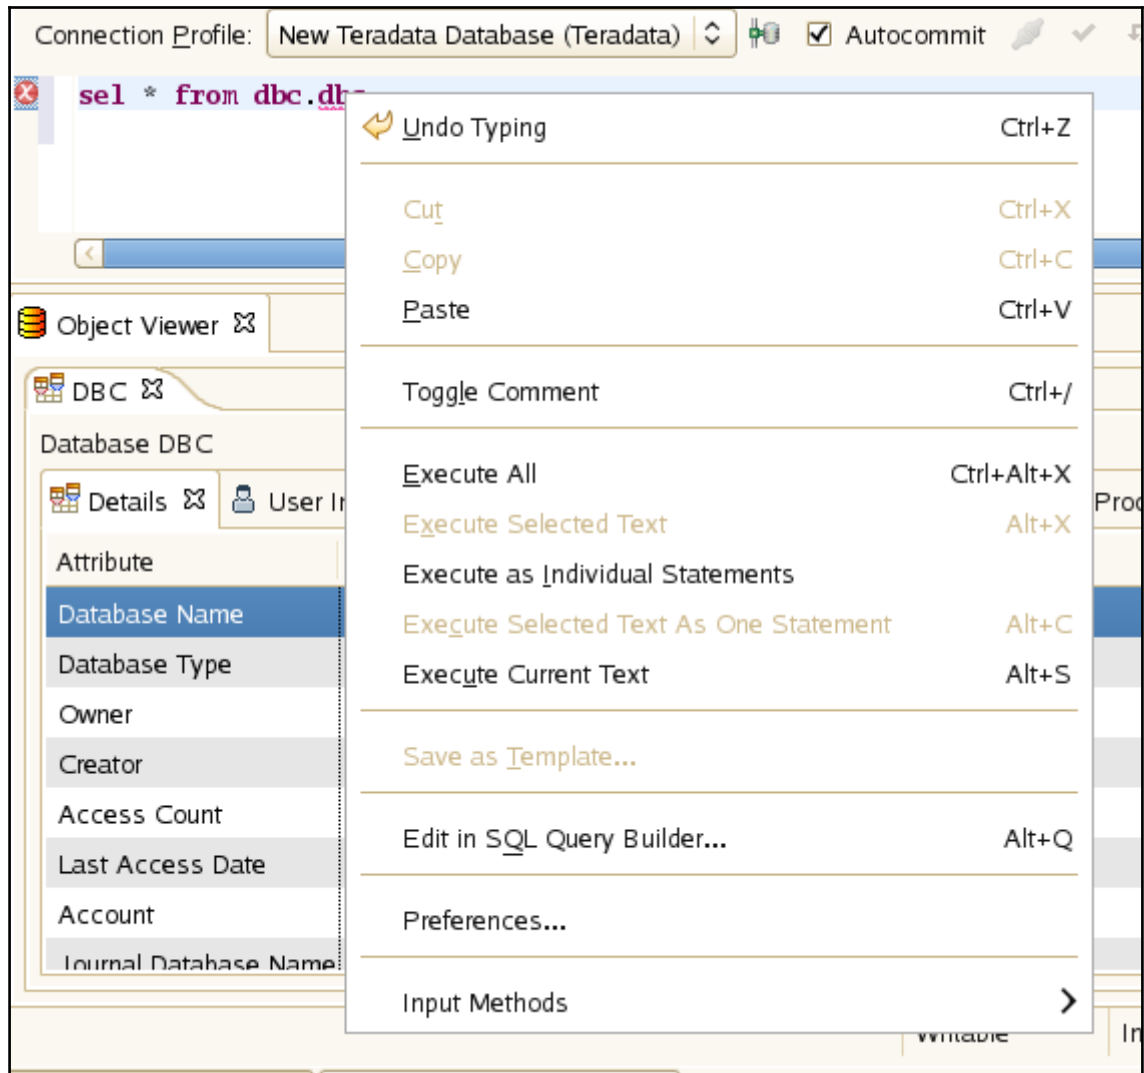

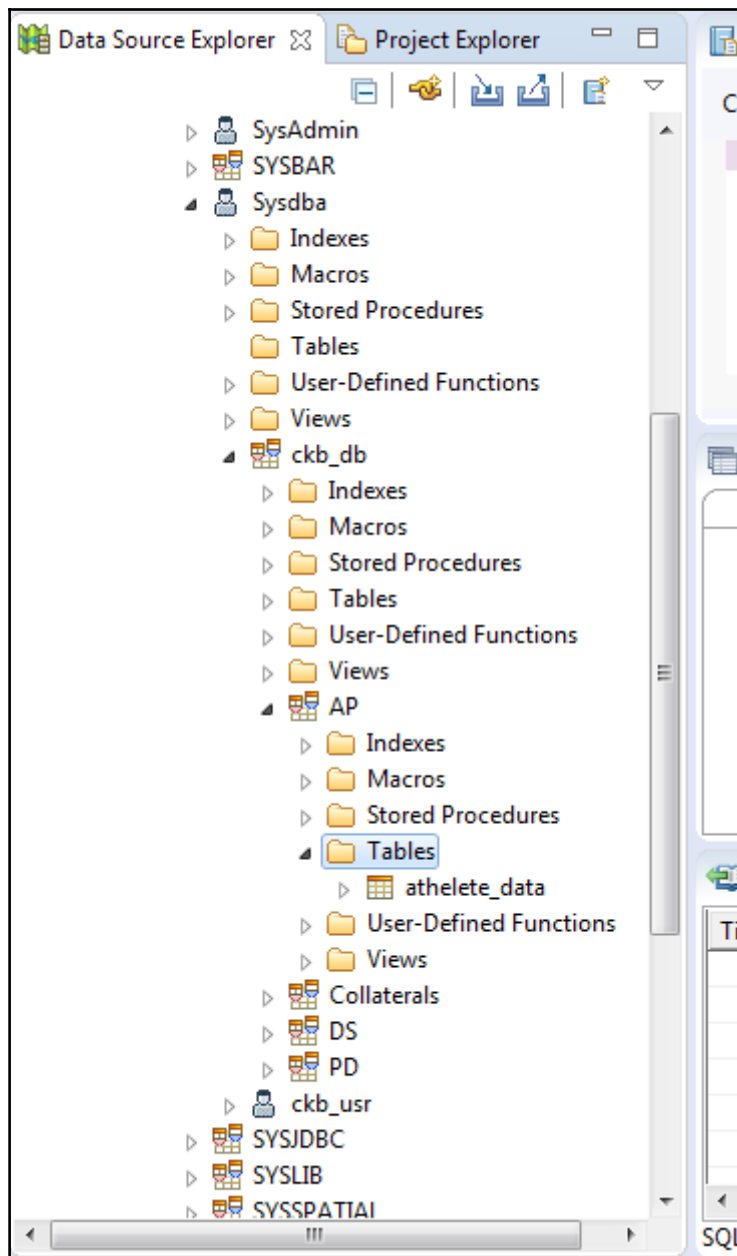

```
SELECT DBC."AccessLogV"."LogDate", DBC."AccessLog"."LogDate"  
FROM  
  DBC."AccessLog" JOIN DBC."AccessLogV" ON DBC."AccessLog"."LogDate" = DBC."AccessLogV"."LogDate"
```

The screenshot shows a database query tool interface. At the top, a text area contains a SQL query: `SELECT DBC."AccessLogV"."LogDate", DBC."AccessLog"."LogDate" FROM DBC."AccessLog" JOIN DBC."AccessLogV" ON DBC."AccessLog"."LogDate" = DBC."AccessLogV"."LogDate"`. Below the query editor is a diagram showing two tables, `AccessLog` and `AccessLogV`, connected by a line with a diamond symbol, indicating a relationship. Both tables have a list of fields: `LogDate` (checked), `LogTime` (unchecked), and `LogonDate` (unchecked). To the right of the diagram is a panel titled `SELECT Statement`. Below the diagram is a section with a `DISTINCT` checkbox. At the bottom, there are tabs for `Columns`, `Conditions`, `Groups`, and `Group Conditions`. The `Columns` tab is active, showing a table with the following structure:

Column	Operator	Value	AND/OR

Import Data into [New Teradata] AP.athlete_data

Import a file to a Table

Input File: *C:\Users\A...\Desktop\...CookBook\chap 1\tableau_test_sets\athletes.csv

File Type: Delimited Text

Column Labels in First Row

Stop Loading If Max 20 Error(s) Occur

Lock Table

Replace Existing Data

Include Null Row

File Options

Column Delimiter: * Comma

```

IF the source and target rows ...	THEN the merge operation is an ...
Satisfy the matching condition	update based on the specified WHEN MATCHED THEN UPDATE clause.
Do not satisfy the matching condition	insert based on the specified WHEN NOT MATCHED THEN INSERT clause.

Chapter 3: Advanced SQL with Backup and Restore

```
Query x History x
CREATE VOLATILE TABLE EMP_TBL1
(
  EMP_ID INTEGER,
  EMP_NAME VARCHAR(25),
  EMP_DEPT INTEGER
) with data
primary index(EMP_ID)
on commit preserve rows;
INSERT INTO EMP_TBL1 VALUES (1,'Rajesh',10);
INSERT INTO EMP_TBL1 VALUES (2,'Rob',11);
INSERT INTO EMP_TBL1 VALUES (3,'Joey',10);
INSERT INTO EMP_TBL1 VALUES (4,'Ross',21);
INSERT INTO EMP_TBL1 VALUES (5,'Rose',22);

Query x History x
CREATE VOLATILE TABLE DEPT_TBL2
(
  DEPT_ID INTEGER,
  DEPT_NAME VARCHAR(10),
  DEPT_CNTRY VARCHAR(10)
) with data
PRIMARY INDEX(DEPT_ID)
on commit preserve rows;
INSERT INTO DEPT_TAB VALUES (10,'IT','IN');
INSERT INTO DEPT_TAB VALUES (11,'HR','US');
INSERT INTO DEPT_TAB VALUES (21,'MKT','AUS');
```

EMP_ID	EMP_NAME	EMP_DEPT
1	3 Joey	10
2	1 Rajesh	10
3	2 Rob	11
4	4 Ross	21

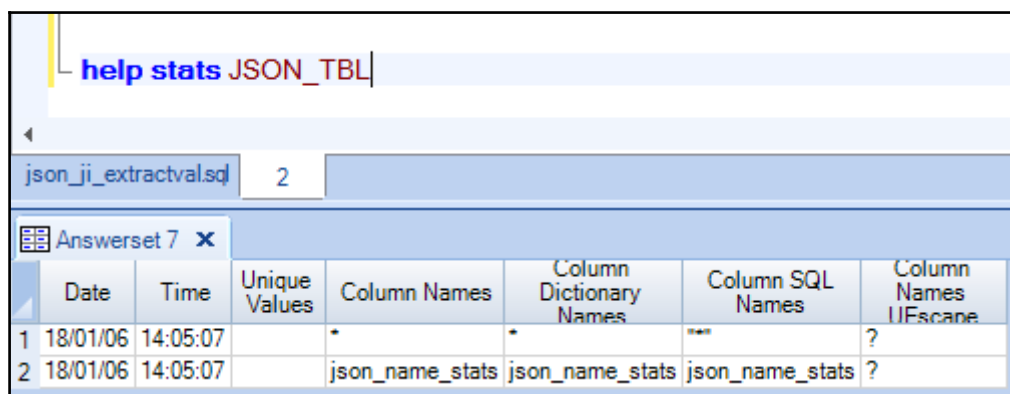

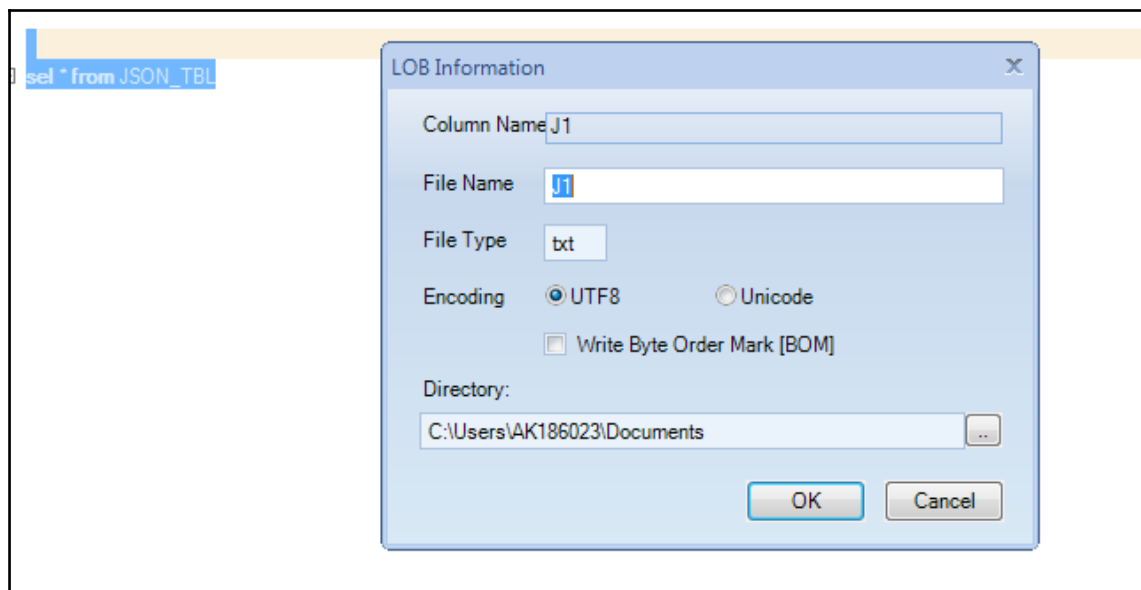

- 1) First, we do an all-AMPs **RETRIEVE** step from **DBC.TB1** by way of an **all-rows scan** with no residual conditions into **Spool 2** (all_amps), which is **redistributed** by the hash code of (**DBC.TB1.EMP_DEPT**) to all AMPs. Then we do a **SORT** to order **Spool 2** by row hash. The size of **Spool 2** is estimated with high confidence to be **5 rows** (155 bytes). The estimated time for this step is 0.01 seconds.
- 2) Next, we do an all-AMPs **JOIN** step from **Spool 2** (Last Use) by way of an **all-rows scan**, which is joined to **DBC.TB2** by way of an **all-rows scan** with a condition of ("NOT (DBC.TB2.DEPT_ID IS NULL)"). **Spool 2** and **DBC.TB2** are joined using an inclusion **merge join**, with a join condition of ("(NOT (EMP_DEPT IS NULL)) AND (EMP_DEPT = DBC.TB2.DEPT_ID)"). The result goes into **Spool 1** (group_amps), which is **built locally** on the AMPs. The size of **Spool 1** is estimated with index join confidence to be **5 rows** (195 bytes). The estimated time for this step is 0.05 seconds.
- 3) Finally, we send out an **END TRANSACTION** step to all AMPs involved in processing the request.
 - > The contents of **Spool 1** are sent back to the user as the result of statement 1. The total estimated time is 0.07 seconds.

```
SEL TB1.* FROM EMP_TBL1 TB1
WHERE EXISTS /*Outer Query*/
(
  SEL TB2.DEPT_ID FROM /*Inner Query*/
  DEPT_TBL2 TB2
  WHERE TB1.EMP_DEPT = TB2.DEPT_ID
):
```

1 2

INSERT Failed. 2802: Duplicate row error in DBC.DEPT_TBL2.

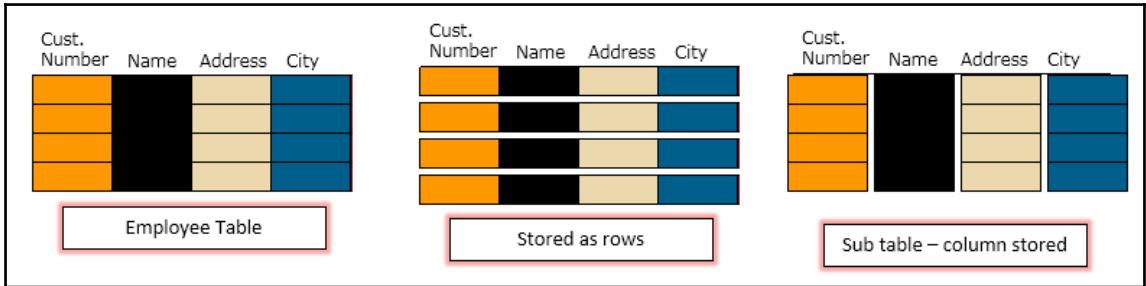

```
Query (local) x History x Answerset 1 x
CREATE VOLATILE TABLE JSON_TBL
(
  EMP_id INTEGER, J1 JSON(1000)
)on commit preserve rows
:
INSERT INTO JSON_TBL VALUES
(2, NEW JSON({'name': 'Roberts', 'Month': 1}));
```

```
INSERT INTO JSON_TBL VALUES  
(2, NEW JSON('{"name": "Ross", "Month": 4}'));
```

json_ji_extractval.sql 2

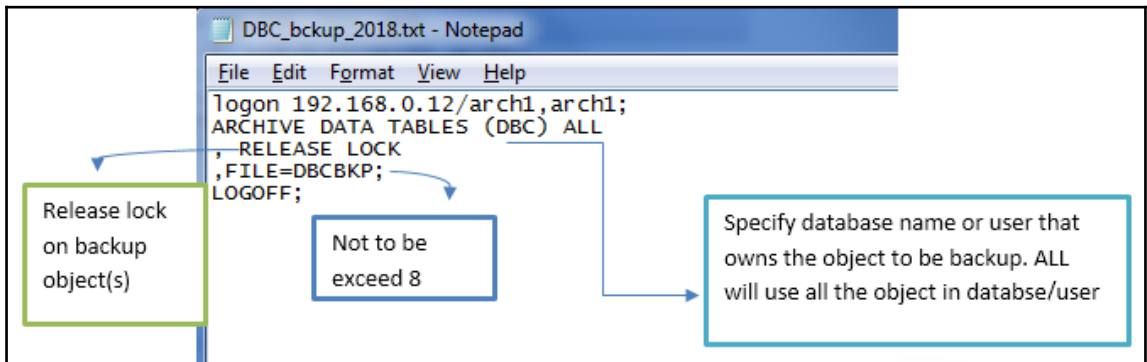

INSERT Failed. 2802: Duplicate row error in DBC.JSON_TBL.

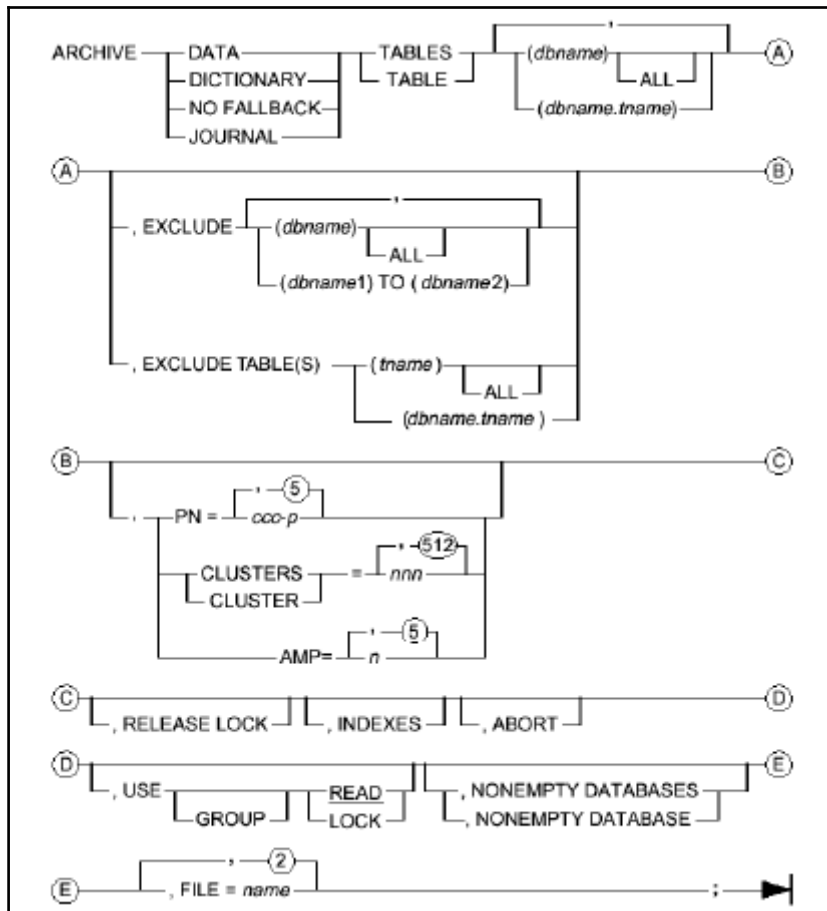

```

Chapter 4: All about Indexes

1) First, we do an all-AMPs **RETRIEVE** step from a **single partition** of **SYSDBA.EMP_SAL_PPI** with a condition of ("SYSDBA.EMP_SAL_PPI.dob = DATE '2017-08-01'") with a residual condition of ("SYSDBA.EMP_SAL_PPI.dob = DATE '2017-08-01'") into **Spool 1** (group_amps), which is **built locally** on the AMPs. The size of **Spool 1** is estimated with **no confidence** to be **1 row** (37 bytes). The estimated time for this step is 0.04 seconds.
 -> The contents of **Spool 1** are sent back to the user as the result of statement 1. The total estimated time is 0.04 seconds.

```

sel id,dept,emp_fname,emp_lname,status from td_cookbook.EMP_SAL
where emp_fname='%Anikta%'
:

```

2 3 4

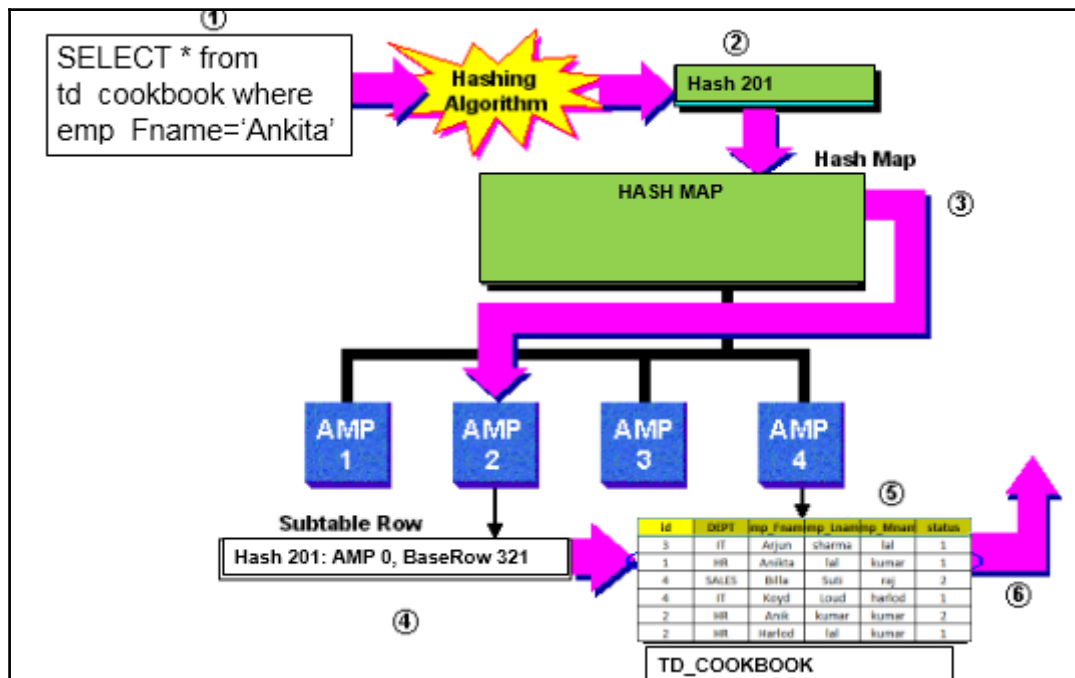

Answerset 9 x Answerset 10 x Answerset 12 x Answerset 13 x Ans

```

3  where emp_fname='%Anikta%';
4
5  1) First, we lock td_cookbook.EMP_SAL for read on a reserved RowHash
6  to prevent global deadlock.
7  2) Next, we lock td_cookbook.EMP_SAL for read.
8  3) We do an all-AMPs RETRIEVE step from td_cookbook.EMP_SAL by way of
9  an all-rows scan with a condition of (
10 "td_cookbook.EMP_SAL.emp_fname = '%Anikta%'") into Spool 1
11 (group_amps), which is built locally on the AMPs. The size of
12 Spool 1 is estimated with no confidence to be 2 rows (118 bytes).
13 The estimated time for this step is 0.04 seconds.
14 4) Finally, we send out an END TRANSACTION step to all AMPs involved
15 in processing the request.

```

Teradata uses...	To...
Primary Index (PI)	satisfy an equality on an IN condition in a join.
Unique Primary Index (UPI)	ensure fastest access to table data.
Non-Unique Primary Index (NUPI)	<ul style="list-style-type: none"> Perform a single-disk row selection or join process Avoid sorting or redistributing rows.
Unique Secondary Index (USI)	process requests that employ equality constraints.
UPIs to match values in one table with index values in another	ensure optimal join performance.
information from a single AMP	estimate the cost of using an index when statistics are not available. This assumes an even distribution of index values (an uneven distribution affects performance).
index based on more than one column (a composite index) only	process requests that employ equality constraints for all fields that comprise the index. You can define an index on a column that is also part of a multi-column index.

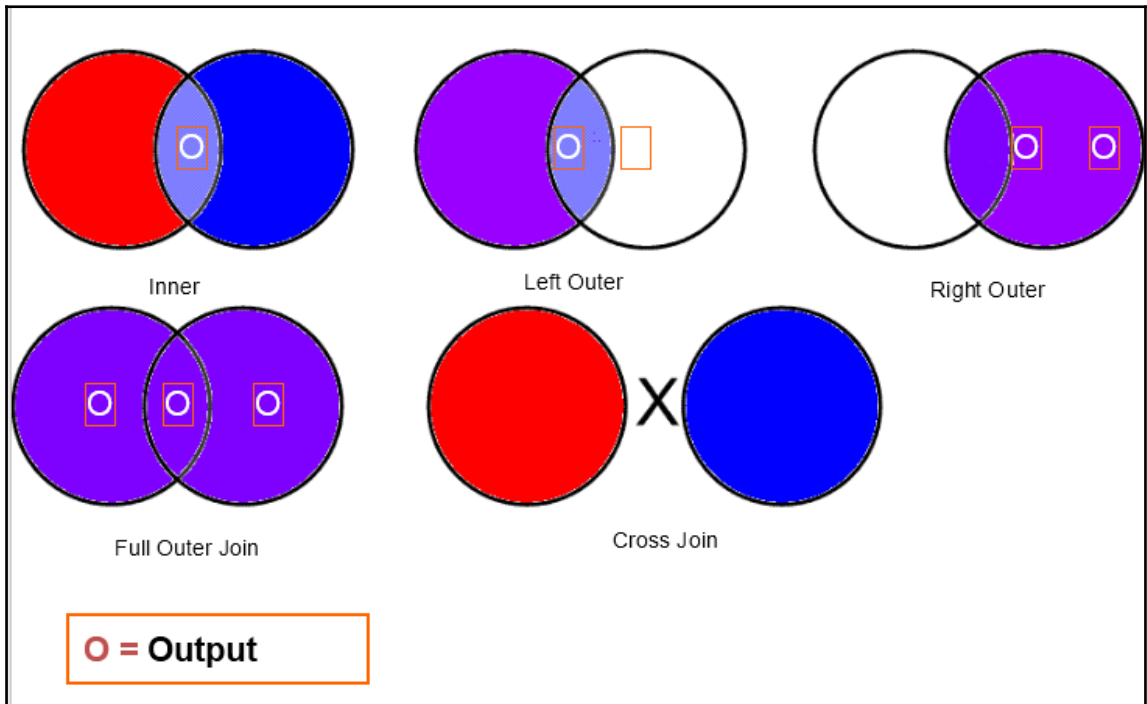

```
Query (local) x History x Answerset 1 x

Query (local) x History x Answerset 1 x Answerset 2 x Answerset 3 x
1 Explain sel id,dept from td_cookbook.EMP_SAL;
2
3 1) First, we lock td_cookbook.EMP_HASH_INX for read on a reserved
4 RowHash to prevent global deadlock.
5 2) Next, we lock td_cookbook.EMP_HASH_INX for read.
6 3) We do an all-AMPs RETRIEVE step from td_cookbook.EMP_HASH_
7 way of an all-rows scan with no residual conditions into Spool 1
8 (group_amps), which is built locally on the AMPs. The size of
9 Spool 1 is estimated with high confidence to be 6 rows (210 bytes).
10 The estimated time for this step is 0.04 seconds.
11 4) Finally, we send out an END TRANSACTION step to all AMPs involved
12 in processing the request.
13 -> The contents of Spool 1 are sent back to the user as the result of
14 statement 1. The total estimated time is 0.04 seconds.
15
```

Chapter 8: Collect Statistics the Better Way

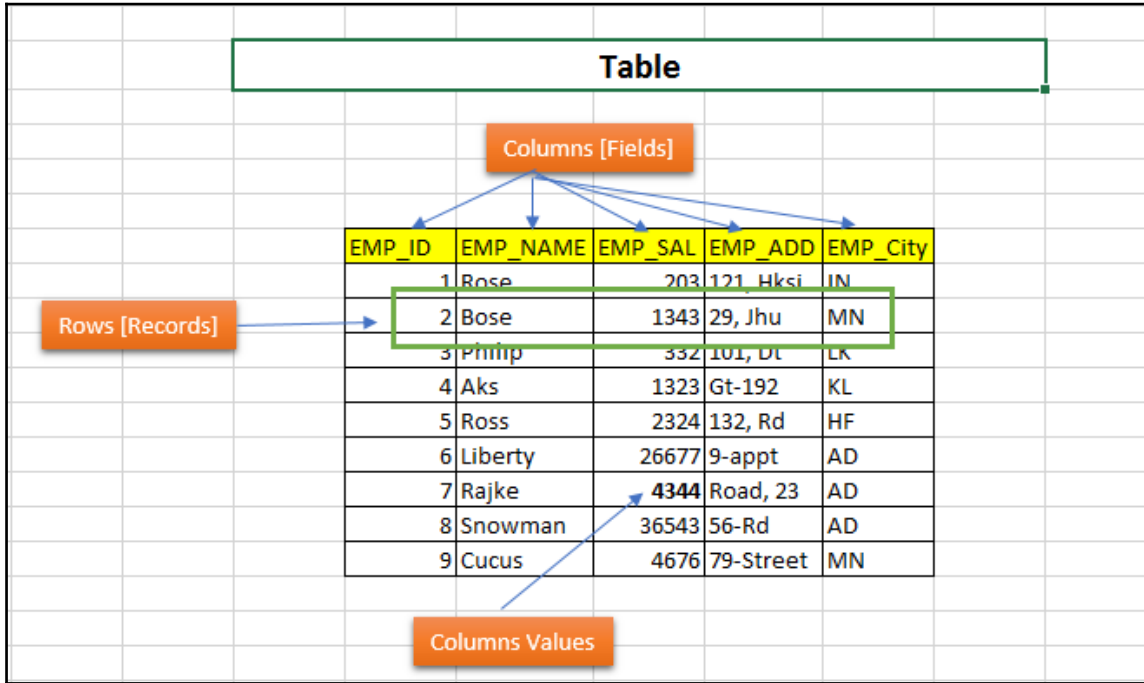

Statistics Version	Teradata Database Release Introduced	Description
1	V2R1	Initial version. Supports up to 100 intervals.
2	V2R5	Added sampling fields to interval 0. Supports up to 100 intervals.
3	12.0	Added new fields NumAllNulls and AvgAMPRPV to interval 0. Raised the default max detailed intervals to 200.
4	12.0.3	Added new fields AllAMPSampleEst and OneAMPSampleEst to interval 0 for better data growth detection.
5	14.0	New histogram layout, larger value length, modifiable number of intervals, history records and SUMMARY statistics.
6	14.10 (with NoDot0BackDown set to TRUE)	New fields added to interval 0 to support UDI counts.

PDE State: RUN/STARTED
    
```

```

Enter a command, HELP or QUIT:
help set

SET [/V] <VprocList> [=] <VprocState> [[,] <VprocList> [=] <VprocState>]...

SET RESTART [=] <RestartKind>

```

- o The first format of this command is used to change the state of a vproc or a list of vprocs. A maximum of 30720 vprocs can be specified. Any state change becomes effective immediately, although **no** changes are made regarding the Message Group(s) the vproc is in and whether it is the Control vproc or not. These changes are deferred until after the next DBS restart. The slash "V" option enables verbose mode if specified.
- o A VprocList is composed of one or more VprocIds or a range of VprocIds as seen below:

```

<VProcList> ::= VprocRange [ [,] VprocRange ]...
<VprocRange> ::= [ VprocId | VprocId TO VprocId ]

```

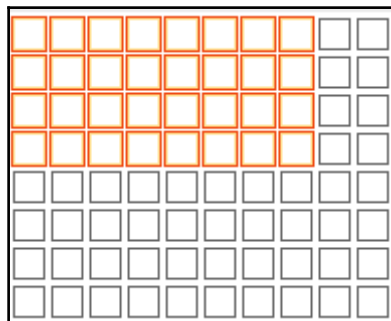

Examples:

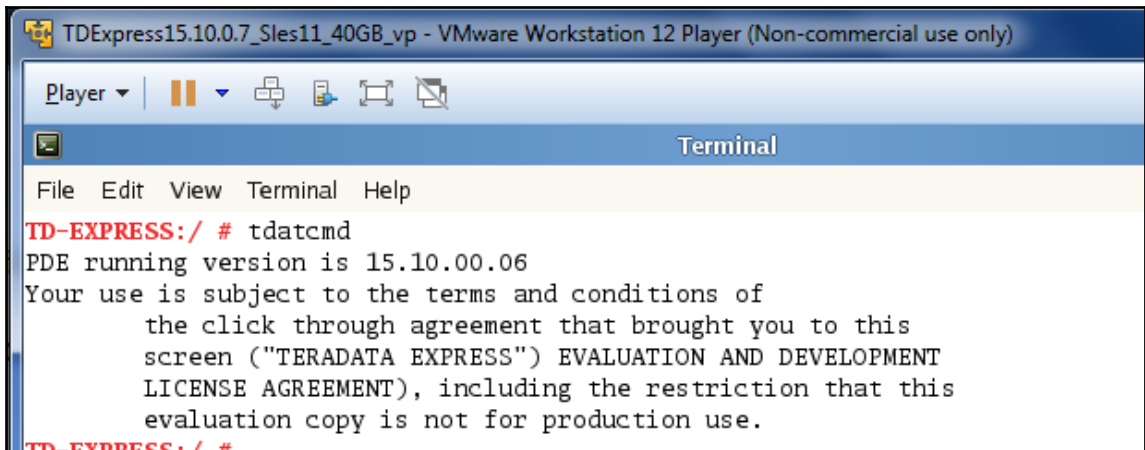

```

0 1 2 3
0, 1, 1022 to 1023
0 to 10, 1021, 1022

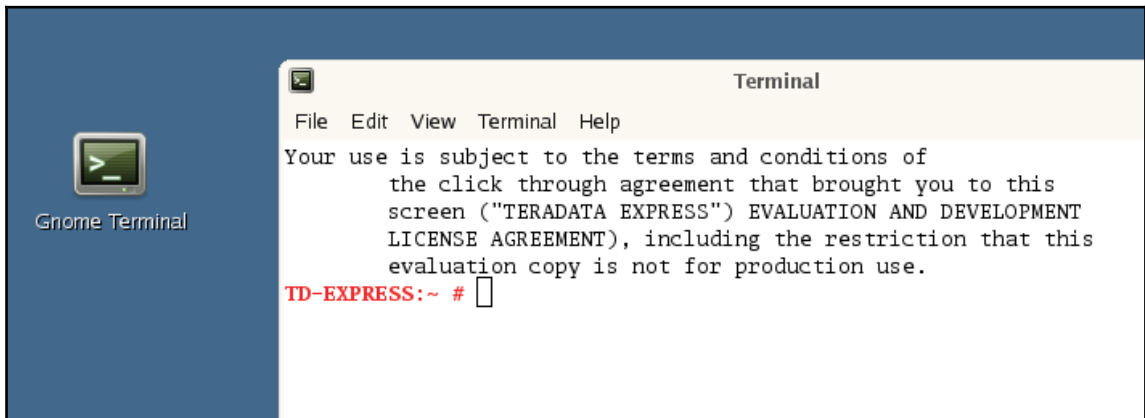

```

- o Valid VprocStates are ONLINE, OFFLINE, UTILITY, NEWPROC, or FATAL. Enter "HELP <VprocState>" for additional information.
- o The second format of this commands is used to define the RestartKind to use during the next DBS restart. It does not force an immediate restart.
- o Valid RestartKinds are COLD or COLDWAIT. Enter "HELP <RestartKind>" for additional information.
