Homebrew

The Missing Package Manager for macOS (or Linux)

English ▾

Install Homebrew

```
$ /bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

Paste that in a macOS Terminal or Linux shell prompt. The script explains what it will do and then pauses before it does it. Read about other [installation options](#).

```
➡ Tapping homebrew/core

Getting Started

Tip

This guide assumes you have a grounding in the tools that Argo CD is based on. Please read [understanding the basics](#) to learn about these tools.

Requirements

- Installed [kubect](#)l command-line tool.
- Have a [kubeconfig](#) file (default location is `~/.kube/config`).

1. Install Argo CD

```
kubectl create namespace argocd  
kubectl apply -n argocd -f https://raw.githubusercontent.com/argoproj/argo-cd/stable/manifests/install.yaml
```

```
Warning: apiextensions.k8s.io/v1beta1 CustomResourceDefinition is deprecated in v1.  
customresourcedefinition.apiextensions.k8s.io/applications.argoproj.io created  
customresourcedefinition.apiextensions.k8s.io/appprojects.argoproj.io created  
serviceaccount/argocd-application-controller created  
serviceaccount/argocd-dex-server created  
serviceaccount/argocd-redis created  
serviceaccount/argocd-server created  
role.rbac.authorization.k8s.io/argocd-application-controller created

2. Download Argo CD CLI

Download the latest Argo CD version from <https://github.com/argoproj/argo-cd/releases/latest>. More detailed installation instructions can be found via the [CLI installation documentation](#).

Also available in Mac Homebrew:

```
brew install argocd
```

```
=> Downloading https://homebrew.bintray.com/bottles/ar
=> Downloading from https://d29vzk4ow07wi7.cloudfront.
#####
=> Pouring argocd-1.8.3.big_sur.bottle.tar.gz
=> Caveats
zsh completions have been installed to:
  /usr/local/share/zsh/site-functions
=> Summary
📦 /usr/local/Cellar/argocd/1.8.3: 8 files, 69.7MB
```

```
argocd: v1.8.3+0f9c684.dirty
BuildDate: 2021-01-23T03:52:47Z
GitCommit: 0f9c68427882bf4633d395cbfcd7c9271795fd9b
GitTreeState: dirty
GoVersion: go1.15.7
Compiler: gc
Platform: darwin/amd64
```

3. Access The Argo CD API Server

By default, the Argo CD API server is not exposed with an external IP. To access the API server, choose one of the following techniques to expose the Argo CD API server:

Service Type Load Balancer

Change the argocd-server service type to `LoadBalancer`:

```
kubectl patch svc argocd-server -n argocd -p '{"spec": {"type": "LoadBalancer"}}'
```

Argo CD 1.8 and earlier

The initial password is autogenerated to be the pod name of the `argocd-server` pod.
This can be retrieved with the command:

```
kubectl get pods -n argocd -l app.kubernetes.io/name=argocd
```

Using the username `admin` and the password from above, login to the Argo CD UI using the `argocd login` command and the hostname:

```
argocd login <ARGOCD_SERVER> # e.g. localhost:8080 or argocd.example.com
```

Change the password using the command:

```
argocd account update-password
```

5. Register A Cluster To Deploy Apps To (Optional)

This step registers a cluster's credentials to Argo CD, and is only necessary when deploying to an external cluster. When deploying internally (to the same cluster that Argo CD is running in), `https://kubernetes.default.svc` should be used as the application's K8s API server address.

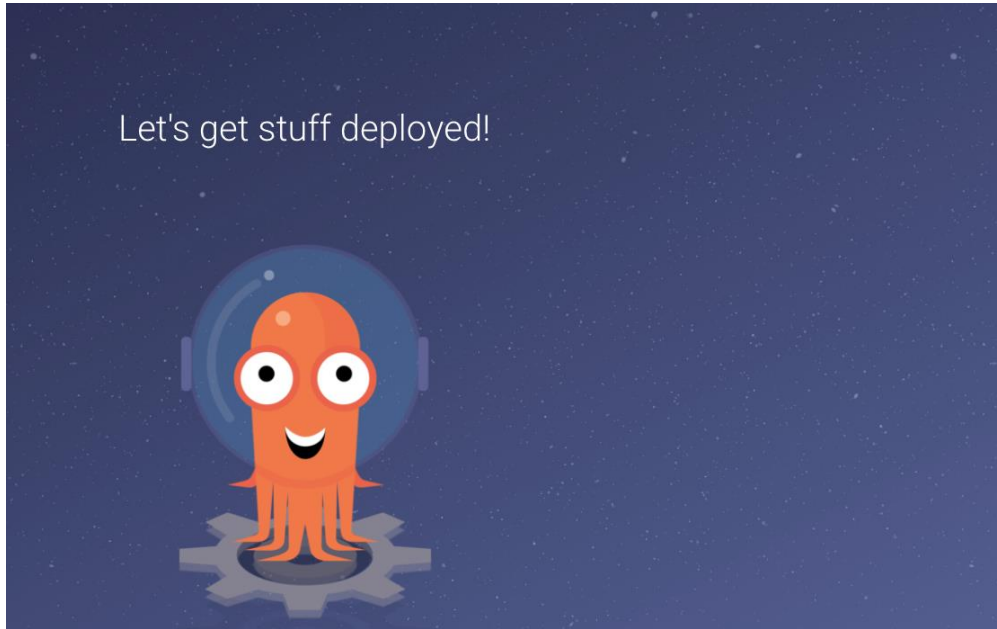

First list all clusters contexts in your current kubeconfig:

```
kubectl config get-contexts -o name
```

Choose a context name from the list and supply it to `argocd cluster add CONTEXTNAME`.

```
INFO[0000] ServiceAccount "argocd-manager" created in namespace "kube-system"  
INFO[0000] ClusterRole "argocd-manager-role" created  
INFO[0000] ClusterRoleBinding "argocd-manager-role-binding" created  
Handling connection for 8080  
Cluster 'https://192.168.99.103:8443' added
```

Webhooks / Manage webhook

We'll send a POST request to the URL below with details of any subscribed events. You can also specify which data format you'd like to receive (JSON, x-www-form-urlencoded, etc). More information can be found in our [developer documentation](#).

Payload URL *

<https://app.harness.io/gateway/api/webhooks/ZkrQswcOn2knpdl>

Content type

application/json

Secret

SSL verification

By default, we verify SSL certificates when delivering payloads.

Enable SSL verification **Disable (not recommended)**

Which events would you like to trigger this webhook?

Just the push event.

Send me everything.

Let me select individual events.

Active

We will deliver event details when this hook is triggered.

Update webhook **Delete webhook**
