Description

Important: The name that you give your job binary will be the name used in your job execution. If your binary requires a particular name or extension (ie: ".jar"), be sure to include it here.

Select the storage type for your job binary.

- Data Processing internal database
- Swift

For Data Processing internal job binaries, you may choose from the following:

- Choose an existing file
- Upload a new file
- Create a script to be uploaded dynamically

For Object Store job binaries, you must:

- Enter the URL for the file
- Enter the username and password required to access that file

You may also enter an optional description for your job binary.

docker, Elasticsearch, Extending

Public

Active

Description

Elasticsearch is a search server based on Lucene. It provides a distributed, multitenant-capable full-text search engine with a RESTful web interface and schema-free JSON documents.

Description:

Name: Set up for identifying a package.

Tags: Used for identifying and filtering packages.

Public: Defines whether or not a package can be used by other tenants. (Applies to package dependencies)

Active: Allows to hide a package from the catalog. (Applies to package dependencies)

Description: Allows adding additional information about a package.

Restrictions

Enter JavaScript origins, redirect URIs, or both

Authorized JavaScript origins

For use with requests from a browser. This is the origin URI of the client application. It can't contain a wildcard (https://*.example.com) or a path (https://example.com/subdir). If you're using a nonstandard port, you must include it in the origin URI.

Authorized redirect URIs

For use with requests from a web server. This is the path in your application that users are redirected to after they have authenticated with Google. The path will be appended with the authorization code for access. Must have a protocol. Cannot contain URL fragments or relative paths. Cannot be a public IP address.
