

## Chapter 1: Creating Our First App with Ionic 2

## Sass

Sass support for TextMate & Sublime Text (2 & 3)

v2015.01.06.16.00.00; github.com/nathos/sass-textmate-bundle

```
app.js app
1 import {App, Platform, Config} from 'ionic/ionic';
2 import {TabPage} from './pages/tabs/tabs';
3
4
5 @App({
6   templateUrl: 'build/app.html',
7   // Check out the config API docs for more info
8   // http://ionicframework.com/docs/v2/api/config/Config
9   config: {}
10 })
11 export class MyApp {
12   constructor(platform: Platform) {
13     this.root = TabPage;
14
15     platform.ready().then(() => {
16       // Do any necessary cordova or native calls here
17     });
18   }
19 }
20
```

Create Project

The screenshot shows the application editor interface. At the top left, there is a logo and the text "myApp". Below it, a "Pages" panel shows a "Page" component. The main workspace displays a mobile page design with a status bar at the top showing "12:34 PM" and "100%". The page content is a large blue rectangle. To the right, a "Page" configuration panel is visible, containing fields for "TITLE" (set to "Page"), "ROUTING URL" (set to "/page1"), and a "BACKGROUND IMAGE" section with an "Upload Image" button. Below this, there are sections for "PADDING" (with a toggle switch), "SCROLLING" (with a toggle switch), and "HEADER MARGIN". A help icon (question mark) is also present in the configuration panel.

Export

# Export Project

 IONIC CLI

 ZIP FILE

 PACKAGE

 CREATOR APP

## Export with the Ionic CLI Tool.

Start (and export) an Ionic app with the [Ionic CLI](#) following these directions:

 Watch CLI Tutorial

```
$ npm install -g cordova ionic
$ ionic start [appName] creator:65199e2cb5b0
```

Check out our CLI's [Documentation](#) page for more information.

If you already have the Ionic CLI installed, please make sure you run the `npm install -g ionic` command to update your CLI version before trying to start a Creator project.

## Chapter 6: User Authentication and Push Notification

### Using Ionic Cloud

iOS App IDs	
5 App IDs total.	
Name	ID
Xcode iOS Wildcard App ID	*

## Registering an App ID

The App ID string contains two parts separated by a period (.) — an App ID Prefix that is defined as your Team ID by default and an App ID Suffix that is defined as a Bundle ID search string. Each part of an App ID has different and important uses for your app. [Learn More](#)

### App ID Description

Name:   
 You cannot use special characters such as @, &, \*, ', "

### App ID Suffix

**Explicit App ID**

If you plan to incorporate app services such as Game Center, In-App Purchase, Data Protection, and iCloud, or want a provisioning profile unique to a single app, you must register an explicit App ID for your app.

To create an explicit App ID, enter a unique string in the Bundle ID field. This string should match the Bundle ID of your app.

Bundle ID:

We recommend using a reverse-domain name style string (i.e., com.domainname.appname). It cannot contain an asterisk (\*).

**Wildcard App ID**

This allows you to use a single App ID to match multiple apps. To create a wildcard App ID, enter an asterisk (\*) as the last digit in the Bundle ID field.

Bundle ID:

Example: com.domainname.\*

## App Services

Select the services you would like to enable in your app. You can edit your choices after this App ID has been registered.

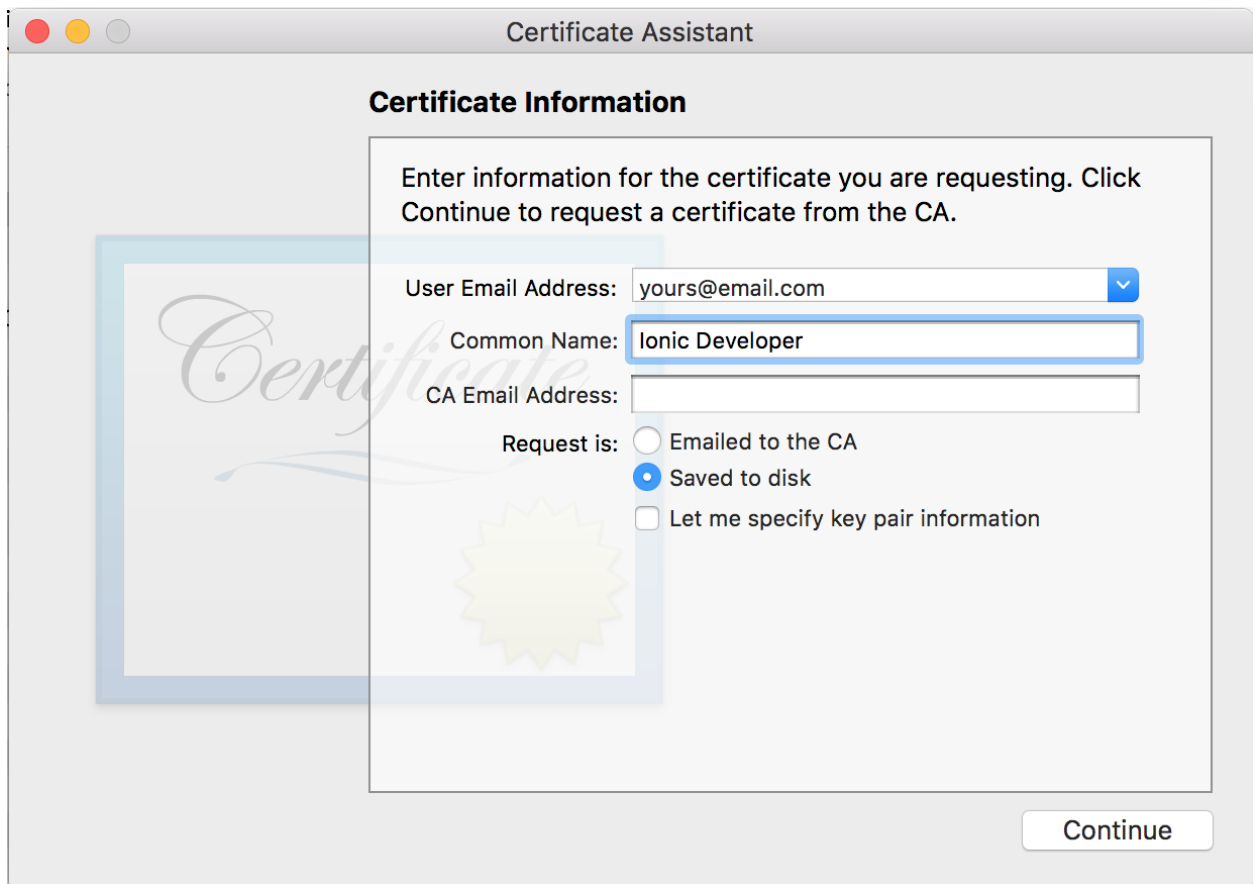

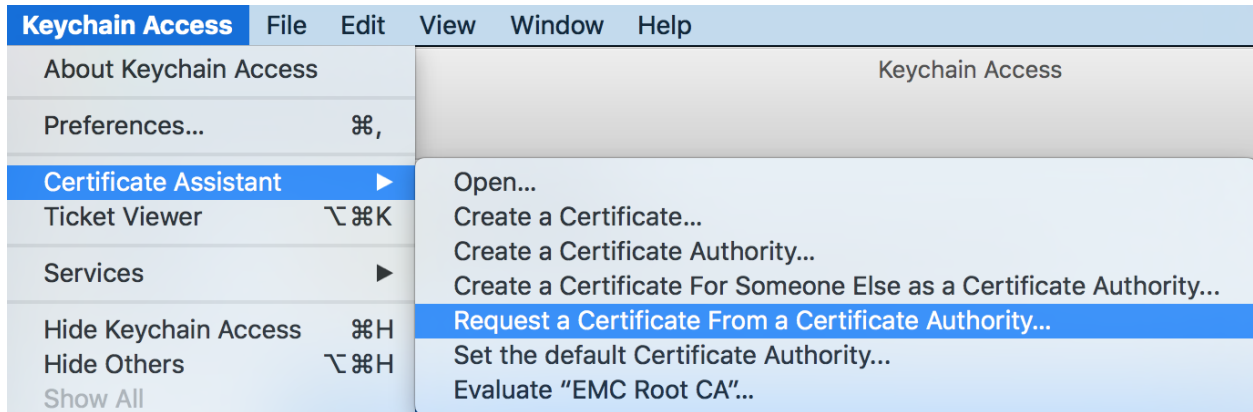

- Enable Services:
- App Groups
  - Apple Pay
  - Associated Domains
  - Data Protection
    - Complete Protection
    - Protected Unless Open
    - Protected Until First User Authentication
  - Game Center
  - HealthKit
  - HomeKit
  - iCloud
    - Compatible with Xcode 5
    - Include CloudKit support (requires Xcode 6)
  - In-App Purchase
  - Inter-App Audio
  - Personal VPN
  - Push Notifications
  - SiriKit
  - Wallet
  - Wireless Accessory Configuration

iOS Certificates +

1 Certificates Total

Name	Type	Expires
Hoc PHAN	iOS Distribution	Sep 09, 2017

Select Type Request Generate Download

## What type of certificate do you need?

### Development

- iOS App Development**  
Sign development versions of your iOS app.
- Apple Push Notification service SSL (Sandbox)**  
Establish connectivity between your notification server and the Apple Push Notification service sandbox environment to deliver remote notifications to your app. A separate certificate is required for each app you develop.

To manually generate a Certificate, you need a Certificate Signing Request (CSR) file from your Mac. To create a CSR file, follow the instructions below to create one using Keychain Access.

### Create a CSR file.

In the Applications folder on your Mac, open the Utilities folder and launch Keychain Access.

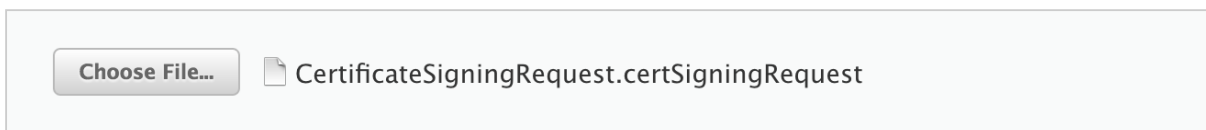

Within the Keychain Access drop down menu, select Keychain Access > Certificate Assistant > Request a Certificate from a Certificate Authority.

- In the Certificate Information window, enter the following information:
  - In the User Email Address field, enter your email address.
  - In the Common Name field, create a name for your private key (e.g., John Doe Dev Key).
  - The CA Email Address field should be left empty.
  - In the "Request is" group, select the "Saved to disk" option.
- Click Continue within Keychain Access to complete the CSR generating process.

### Upload CSR file.

Select .certSigningRequest file saved on your Mac.

## Download, Install and Backup

Download your certificate to your Mac, then double click the .cer file to install in Keychain Access. Make sure to save a backup copy of your private and public keys somewhere secure.

**Apple Push Notification service SSL Certificates**

To configure push notifications for this iOS App ID, a Client SSL Certificate that allows your notification server to connect to the Apple Push Notification Service is required. Each iOS App ID requires its own Client SSL Certificate. Manage and generate your certificates below.

 <b>Development SSL Certificate</b>
Create an additional certificate to use for this App ID. <a href="#">Create Certificate...</a>
 <b>Production SSL Certificate</b>
Create an additional certificate to use for this App ID. <a href="#">Create Certificate...</a>

## About Creating a Certificate Signing Request (CSR)

---

To manually generate a Certificate, you need a Certificate Signing Request (CSR) file from your Mac. To create a CSR file, follow the instructions below to create one using Keychain Access.

### Create a CSR file.

In the Applications folder on your Mac, open the Utilities folder and launch Keychain Access.

Within the Keychain Access drop down menu, select Keychain Access > Certificate Assistant > Request a Certificate from a Certificate Authority.

- In the Certificate Information window, enter the following information:
  - In the User Email Address field, enter your email address.
  - In the Common Name field, create a name for your private key (e.g., John Doe Dev Key).
  - The CA Email Address field should be left empty.
  - In the "Request is" group, select the "Saved to disk" option.
- Click Continue within Keychain Access to complete the CSR generating process.

Cancel

Back

Continue

## Generate your certificate.

When your CSR file is created, a public and private key pair is automatically generated. Your private key is stored on your computer. On a Mac, it is stored in the login Keychain by default and can be viewed in the Keychain Access app under the "Keys" category. Your requested certificate is the public half of your key pair.

### Upload CSR file.

Select .certSigningRequest file saved on your Mac.

Choose File...

### Upload CSR file.

Select .certSigningRequest file saved on your Mac.

Choose File...

📄 CertificateSigningRequest.certSigningRequest

Cancel

Back

Continue

Your certificate is ready.

### Download, Install and Backup

Download your certificate to your Mac, then double click the .cer file to install in Keychain Access. Make sure to save a backup copy of your private and public keys somewhere secure.

About this API

[Documentation](#) ^

Add maps based on Google Maps data to your iOS application with the Google Maps SDK for iOS. The SDK automatically handles access to the Google Maps servers, map display and response to user gestures such as clicks and drags.

Using credentials with this API

Using an API key

To use this API you need an API key. An API key identifies your project to check quotas and access. Go to the Credentials page to get an API key. You'll need a key for each platform, such as Web, Android, and iOS. [Learn more](#)

# API API Manager

Dashboard

Library

Credentials

**API key**  
Identifies your project using a simple API key to check quota and access.  
For APIs like Google Translate.

**OAuth client ID**  
Requests user consent so your app can access the user's data.  
For APIs like Google Calendar.

**Service account key**  
Enables server-to-server, app-level authentication using robot accounts.  
For use with Google Cloud APIs.

**Help me choose**  
Asks a few questions to help you decide which type of credential to use

**Create credentials** ▾

### Key restriction

Key restriction lets you specify which web sites, IP addresses, or apps can use this key. [Learn more](#)

- None
- HTTP referrers (web sites)
- IP addresses (web servers, cron jobs, etc.)
- Android apps
- iOS apps

Accept requests from an iOS application with one of these bundle identifiers (Optional)

com.ionicframework.taxiapp319361

com.example.MyApp

Create credentials ▾

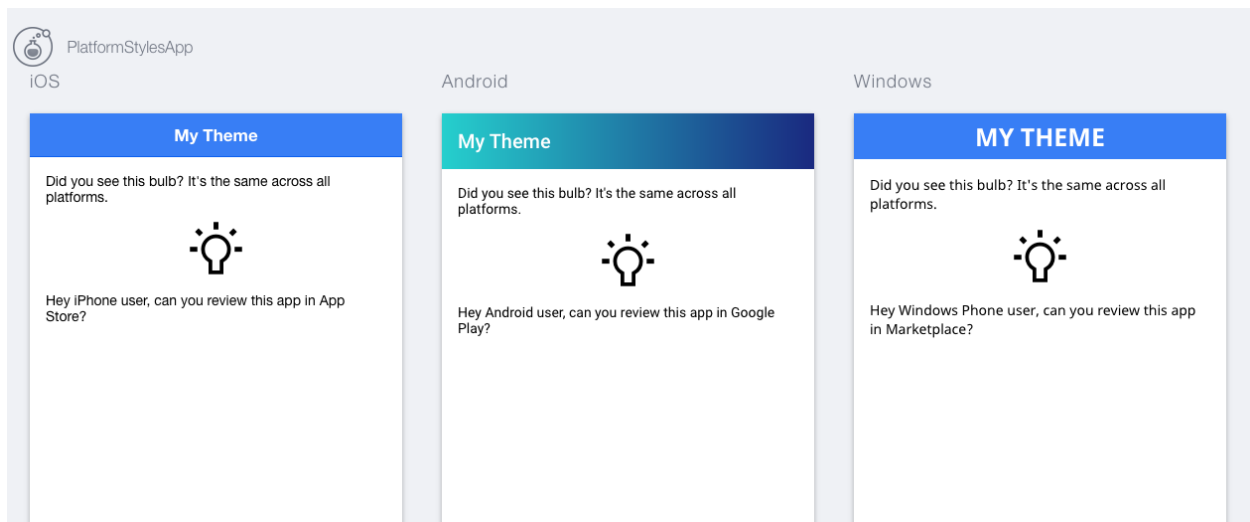

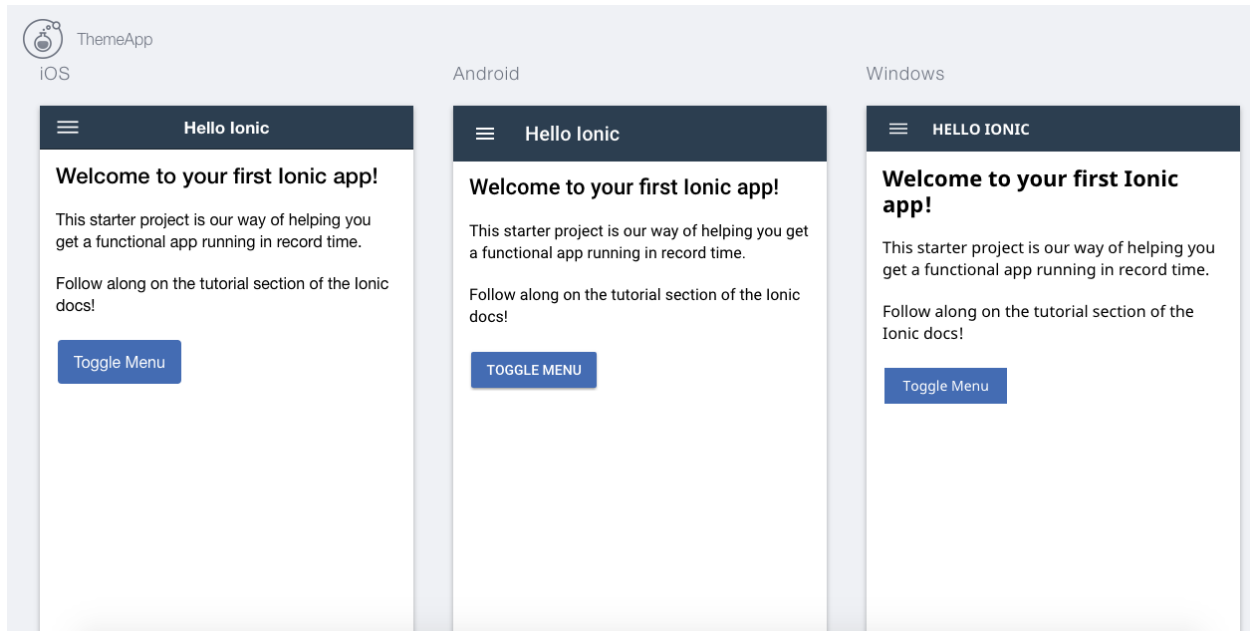

Delete

Create credentials to access your enabled APIs. [Refer to the API documentation](#) for details.

## Chapter 9: Publishing the App for Different Platforms

◀ Back to Photos

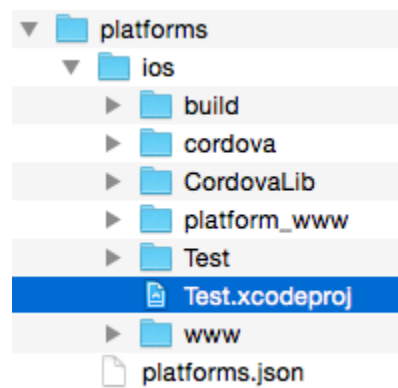

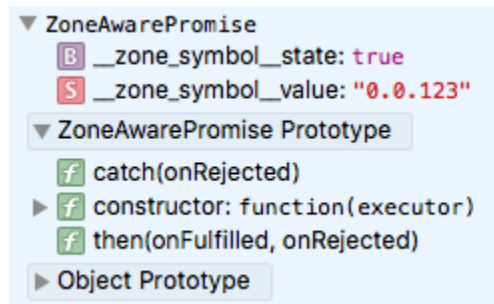

11:21 PM

# MyAppVersion

Get App Version

MyAppVersion 0.0.123

The screenshot shows the Xcode interface for the 'Test' target. The left sidebar displays the project structure, including files like 'config.xml', 'www', 'merges', 'Staging', and 'CordovaLib.xcodeproj'. The main panel shows the 'General' settings tab, which is divided into two sections: 'Identity' and 'Deployment Info'. In the 'Identity' section, the Bundle Identifier is 'com.ionicframework.test791491', Version is '0.0.1', Build is '0.0.1', and Team is 'None'. The 'Deployment Info' section shows the Deployment Target is '6.0' and Devices are set to 'Universal'. Below these, there are buttons for 'iPhone' and 'iPad'. Further down, the Main Interface is set to 'Default', Device Orientation has four options (Portrait, Upside Down, Landscape Left, Landscape Right) all of which are unchecked, and Status Bar Style is 'Default' with an unchecked 'Hide status bar' option.

## Certificates, Identifiers & Profiles

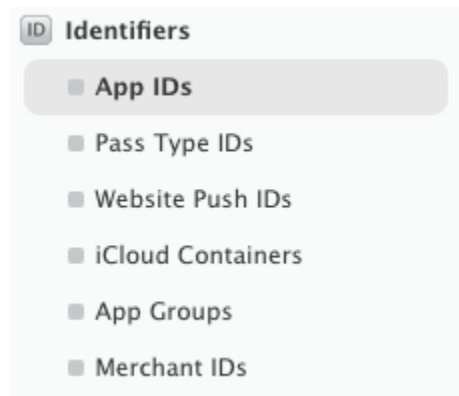

Manage the certificates, identifiers, profiles, and devices you need to develop and distribute apps.

## What type of certificate do you need?

### Development

- iOS App Development**  
Sign development versions of your iOS app.
- Apple Push Notification service SSL (Sandbox)**  
Establish connectivity between your notification server and the Apple Push Notification service sandbox environment to deliver remote notifications to your app. A separate certificate is required for each app you develop.

## Registering an App ID

The App ID string contains two parts separated by a period (.) — an App ID Prefix that is defined as your Team ID by default and an App ID Suffix that is defined as a Bundle ID search string. Each part of an App ID has different and important uses for your app. [Learn More](#)

### App ID Description

Name:

You cannot use special characters such as @, &, \*, ', "

## App ID Suffix

- **Explicit App ID**

If you plan to incorporate app services such as Game Center, In-App Purchase, Data Protection, and iCloud, or want a provisioning profile unique to a single app, you must register an explicit App ID for your app.

To create an explicit App ID, enter a unique string in the Bundle ID field. This string should match the Bundle ID of your app.

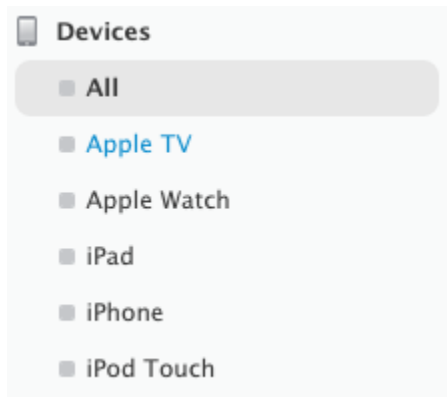

Bundle ID:

We recommend using a reverse-domain name style string (i.e., com.domainname.appname). It cannot contain an asterisk (\*).

## App Services

Select the services you would like to enable in your app. You can edit your choices after this App ID has been registered.

- Enable Services:
- App Groups
  - Apple Pay
  - Associated Domains
  - Data Protection
    - Complete Protection
    - Protected Unless Open
    - Protected Until First User Authentication
  - Game Center
  - HealthKit
  - HomeKit
  - iCloud
    - Compatible with Xcode 5
    - Include CloudKit support (requires Xcode 6)
  - In-App Purchase
  - Inter-App Audio
  - Personal VPN
  - Push Notifications
  - SiriKit
  - Wallet
  - Wireless Accessory Configuration

All Devices

**Register Device**

Name your device and enter its Unique Device Identifier (UDID).

Name:

UDID:

 **Provisioning Profiles**

- All
- Development
- Distribution

iOS Provisioning Profiles

## What type of provisioning profile do you need?

### Development

- iOS App Development**  
Create a provisioning profile to install development apps on test devices.
- tvOS App Development**  
Create a provisioning profile to install development apps on tvOS test devices.

### Distribution

- App Store**  
Create a distribution provisioning profile to submit your app to the App Store.

Select Type

Configure

Generate

Download

## Select App ID.

If you plan to use services such as Game Center, In-App Purchase, and Push Notifications, or want a Bundle ID unique to a single app, use an explicit App ID. If you want to create one provisioning profile for multiple apps or don't need a specific Bundle ID, select a wildcard App ID. Wildcard App IDs use an asterisk (\*) as the last digit in the Bundle ID field. Please note that iOS App IDs and Mac App IDs cannot be used interchangeably.

App ID:
