Business Requirements

1. Normalize Data
2. Remove Samples
3. Change Timestamp Format
4. Filter by Demographics
5. Match Populations

Lexical (Monadic) Workflow

```
step := Get(data)
step = Next(step, NormalizeData)
step = Next(step, RemoveSamples)
step = Next(step, ChangeTimestamp)
step = Next(step, FilterByDemographics)
step = Next(step, MatchPopulations)
if err != nil {
        // handle errors
} else {
        // handle success
}
```

Tail Call Optimization in Go - S

Everything you can find over the Internet, that "Go supports tailable recursions in some cases", and that was told in mailing list:
It is already there in 6g/8g for certain cases, and in gccgo somewhat more generally.
We do not currently plan to change the language to require that compilers implement tail call optimization in all cases. If you must have a tail call, you use a loop or a goto statement.
To get those cases you'd better dig into golang source, which is open.

You cannot replace all tail calls by loops or gotos. – rightfold Feb 23 '15 at 14:16

hydroflame commented on Aug 19, 2016
I know it's been discussed that we wanted to keep the stack trace the same, but if gc only does self recursion call optimisation the stack would roughly stay the same, the only thing that would change is the number of frames for the recursive function call.

While I would prefer full-on TCO, this would be a good start!
hydroflame commented on Aug 19, 2016
The go team was very clear that they wanted to keep the stack traces clean and accurate, complete TCO would completely break that. So that's why self-recursino only makes sense, because 1000 000 call to Foo doesn't really help anybody anyway

Many functional programming languages have excellent support for (general) TCO and it is not an impediment at all for debugging. Code compiled in debug mode can still be instrumented to keep count of self-calls and informations about lost stackframes. In functional languages like Haskell, purity from side-effects helps debugging since only the initial values are needed to know the state of every subsequent call; in Go it's not guaranteed so you lose intermediate stackframes and there's no way to recover them, but since most uses for recursive calls are in algorithms, which I hope are implemented in a mathematically sound manner, the issue is greatly reduced. Everything is moving in this direction, and Go should not be left behind.

Also, as dr2chase noted, I often find myself rewriting beautifully recursive code from their mathematical description to ugly hackish iterative style and it is not easy at all to prove they are completely equivalent until your application in production decides to run an infinite loop because the terminating condition is not met with certain inputs.

Do it.

SophisticaSean commented on Jun 21

Would like to add that this would be an amazing feature to have in go. There's just no getting around proper recursion with some algorithms, and if you try, the iterative implementation is terrible to read and understand and, usually, takes way longer to write.

I would love go way more if we did this. I think its a low-impact feature that will help a lot of devs.

l3x commented just now

What if Go supported compiler directives (compiler hints) in the form of annotations in the comment line directly above a function like the following?

```
// @tco yCombinator implements the lambda expression that
// enables composition of unpure components in our workflow
func yCombinator(f FuncFunc) Func {
   g := func(r RecursiveFunc) Func {
       return f(func(x int) int {
           return r(r)(x)
       })
   }
   return g(g)
}
```

I agree with **@SophisticaSean** in that this would likely be a low impact feature that would help a lot of developers, especially the ones that would like to introduce functional programming (FP) techniques in their apps.

Supporting the **@tco** annotation compiler hint would allow Go to support TCO in a backwards compatible manner, right? Optimization for programmers that know what they want, with no ill side effects. What's not to love?

If Go offered TCO support, that would increase the performance of FP apps by approx. three fold and make FP in Go generally viable.

p.s. For a detailed discussion of TCO, Recursion, Y-Combinator, Generics, Monads and more please get a copy of my book (to be released in a few weeks).

Thanks! Lex

Proposal: Union Types

I'm a long-time lurker, but this is my first post to the list, so go easy on me.
Over the past 18 months I've written quite a bit of Go, mostly for private projects. I've really come to love the language and ecosystem!
During that time, I've encountered a number of situations where some sort of generic type/mechanism would be really helpful. Like others, I've worked around it with empty interfaces, code generation, reflection, and anything else that could solve the problem at hand.
However, the general problem domain has been rolling around in the back of my mind for months. Recently I came up with a simple mechanism that I think would be a great fit for the language and would address most of the use cases that people cite when they request generics. The mechanism itself is more akin to union types and is labeled as such. However, the functionality could be used to address the same class of problems as are traditionally covered by generics.
I've written a proposal and posted it here: https://docs.google.com/document/d/12yqVIeYCLBiUBSkpzOWqoqbsB70EcMHHxClJQTIXACI
I would really appreciate any and all feedback.
Thanks!
Bob Z.
