O Ne	w RESTful Web Services from Patterns
Steps 1. Choose File Type 2. Select Pattern 3. Specify Resource Classes	Select Pattern Select a RESTful web service design pattern: Simple Root Resource Container-Item Colient-Controlled Container-Item
	Description: Create a RESTful root resource class with GET and PUT methods using Java API for RESTful Web Service (JSR-311). This pattern is useful for creating a simple HelloWorld service and wrapper services for invoking WSDL-based web services. On the next page you will be specifying class name, URI, and representation type of the resource.

Configure REST Test Client	×
○ Locally Generated Test Client (suitable when cross-domain access to REST resources is enabled)	
Web Test Client in Project Browse	
Target Eolder: C:\Current Books in Progress\Learning Network programming with Java\Chapter 9\SimpleRestfulService\web	
Notice:	
The security restrictions might block access to remote resources from the local filesystem. To access REST resources deploy the test client to the same domain as the resource (Web Test Client in Project option).	
If your browser permits access to remote resources, you can choose your local filesystem as the target (Locally Generated Test Client option). In Internet Explorer, you can enable cross-domain requests in Internet Options dialog box. Another option to allow cross-domain requests, to REST resources provided by the web application, is to set up a Cross-Origin Resource Sharing (CORS) filter.	
To create CORS filter, you can use Web Services -> Cross-Origin Resource Sharing Filter wizard.
