NAME
    Get-Service

SYNOPSIS
    Gets the services on a local or remote computer.

SYNTAX
    Get-Service [-ComputerName <String[]>] [-DependentServices] -DisplayName <String[]> [-Exclude <String[]>]
    [-Include <String[]>] [-RequiredServices] [<CommonParameters>]
    Get-Service [-ComputerName <String[]>] [-DependentServices] [-Exclude <String[]>] [-Include <String[]>]
    [-InputObject <ServiceController[]>] [-RequiredServices] [<CommonParameters>]
    Get-Service [[-Name] <String[]>] [-ComputerName <String[]>] [-DependentServices] [-Exclude <String[]>] [-Include
    <String[]>] [-RequiredServices] [<CommonParameters>]

DESCRIPTION
    The Get-Service cmdlet gets objects that represent the services on a local computer or on a remote computer,
    including running and stopped services.

    You can direct this cmdlet to get only particular services by specifying the service name or display name of the
    services, or you can pipe service objects to this cmdlet.

Administrator: Windows PowerShell
PS C:\Demo> Get-Help Import-Csv

NAME
----
Import-Csv

SYNOPSIS
    Creates table-like custom objects from the items in a CSV file.

SYNTAX
    Import-Csv [[-Path] <String[]>] [[-Delimiter] <Char>] [-Encoding {Unicode | UTF7 | UTF8 | ASCII | UTF32 |
    BigEndianUnicode | Default | OEM}] [-Header <String[]>] [-LiteralPath <String[]>] [<<CommonParameters>]

    Import-Csv [[-Path] <String[]>] [-Encoding {Unicode | UTF7 | UTF8 | ASCII | UTF32 | BigEndianUnicode | Default |
    OEM}] [-Header <String[]>] [-LiteralPath <String[]>] -UseCulture [<<CommonParameters>]

DESCRIPTION
    The Import-Csv cmdlet creates table-like custom objects from the items in CSV files. Each column in the CSV file
    becomes a property of the custom object and the items in rows become the property values. Import-Csv works on any
    CSV file, including files that are generated by the Export-Csv cmdlet.

    You can use the parameters of the Import-Csv cmdlet to specify the column header row and the item delimiter, or
    direct Import-Csv to use the list separator for the current culture as the item delimiter.

    You can also use the ConvertTo-Csv and ConvertFrom-Csv cmdlets to convert objects to CSV strings (and back). These
    cmdlets are the same as the Export-CSV and Import-Csv cmdlets, except that they do not deal with files.

    Beginning in Windows PowerShell 3.0, if a header row entry in a CSV file contains an empty or null value, Windows
    PowerShell inserts a default header row name and displays a warning message. In previous versions of Windows
    PowerShell, if a header row entry in a CSV file contains an empty or null value, the Import-Csv command fails.

Sharing outside your organization

Control how users share content with people outside your organization.

- Don't allow sharing outside your organization
- Allow sharing only with the external users that already exist in your organization's directory
- Allow users to invite and share with authenticated external users
- Allow sharing to authenticated external users and using anonymous access links
 - Anonymous access links expire in this many days: 9 `Set-SPOTenant -RequireAnonymousLinksExpireInDays <int>`

Anonymous access links allow recipients to:

Files: `Set-SPOTenant -FileAnonymousLinkType <None | View | Edit>`

Folders: `Set-SPOTenant -FolderAnonymousLinkType <None | View | Edit>`

Default link type

Choose the type of link that is created by default when users get links. [Learn more.](#)

- Direct - only people who have permission
- Internal - people in the organization only
- Anonymous Access - anyone with the link

`Set-SPOTenant -DefaultSharingLinkType <None | Direct | Internal | AnonymousAccess>`

Additional settings

- Limit external sharing using domains (applies to all future sharing invitations). Separate multiple domains with spaces. [Learn more.](#)
 - Allow sharing only with users from these domains: microsoft.com outlook.com

`Set-SPOTenant -SharingDomainRestrictionMode <AllowList | BlockList> -SharingAllowedDomainList 'outlook.com microsoft.com' -SharingBlockedDomainList '<string>'`
- Prevent external users from sharing files, folders, and sites that they don't own `Set-SPOTenant -PreventExternalUsersFromResharing <$true | $false>`
- External users must accept sharing invitations using the same account that the invitations were sent to `Set-SPOTenant -RequireAcceptingAccountMatchInvitedAccount <$true | $false>`

When users share via anonymous access links, people who receive the link don't need to sign in to access the shared content. Therefore these additional settings don't apply to anonymous access links.

Notifications

E-mail OneDrive for Business owners when

- Other users invite additional external users to shared files `Set-SPOTenant -NotifyOwnersWhenItemsReshared <$true | $false>`
- External users accept invitations to access files `Set-SPOTenant -NotifyOwnersWhenInvitationsAccepted <$true | $false>`
- An anonymous access link is created or changed

PS C:\Windows\system32> Invoke-Expression (New-Object Net.WebClient).DownloadString('https://raw.githubusercontent.com/OfficeDev/PnP-PowerShell/master/Samples/Modules.Install/Install-SharePointPnPPowerShell.ps1')
PowerShellPackageManagement now installed we will now run the next command in 10 Seconds

Confirm
Which version of the Modules do you want to install?
[0] SharePoint Online [6] SharePoint 2016 [3] SharePoint 2013 [?] Help (default is "0"):
The modules for SharePoint Online have been installed and can now be used
On the next release you can just run Update-Module -force to update this and other installed modules
PS C:\Windows\system32> _
```

```
Administrator: Windows PowerShell
PS C:\Windows\system32> Update-Module SharePointPnPPowerShell*
PS C:\Windows\system32> _
```

```
Administrator: Windows PowerShell
PS C:\Windows\system32> Get-Module SharePointPnPPowerShell* -ListAvailable | Select-Object Name,Version -Descending

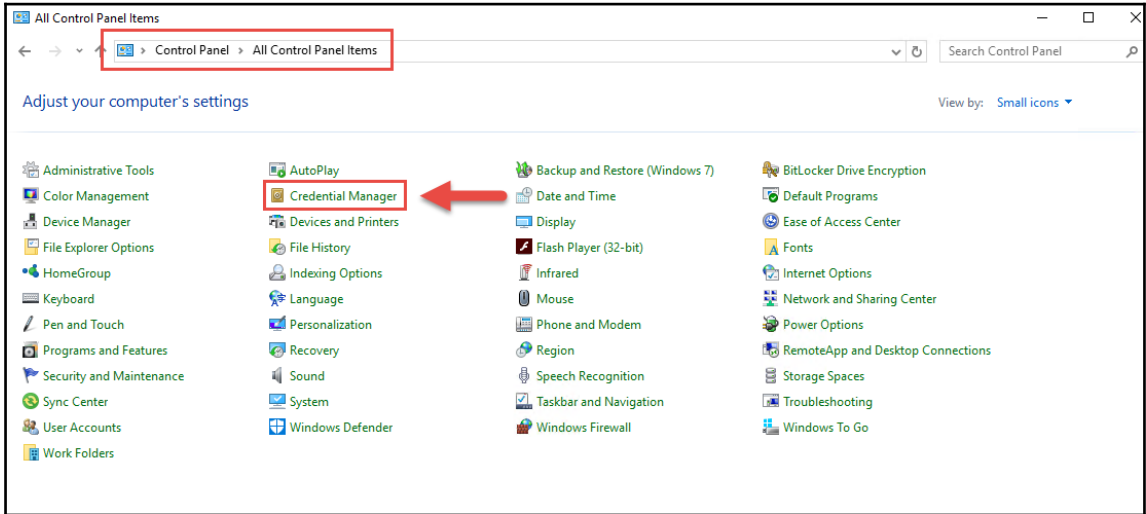

Name                                     Version
-----
SharePointPnPPowerShellOnline           2.16.1706.0
```

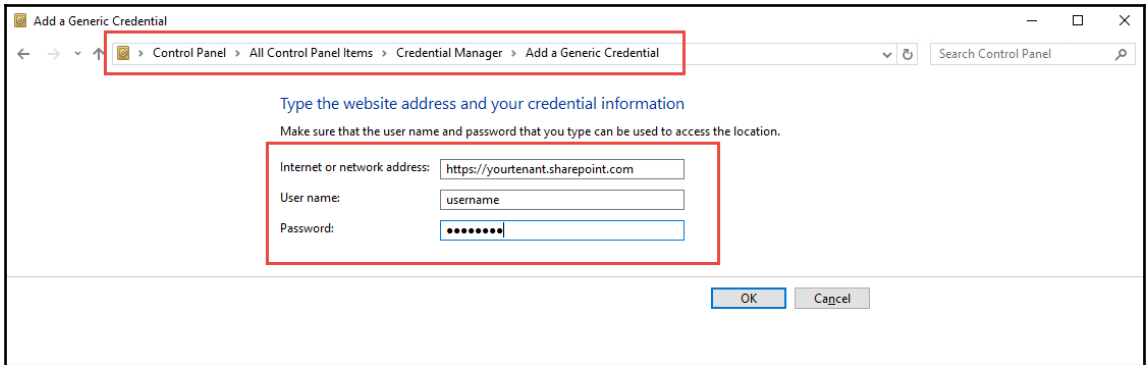

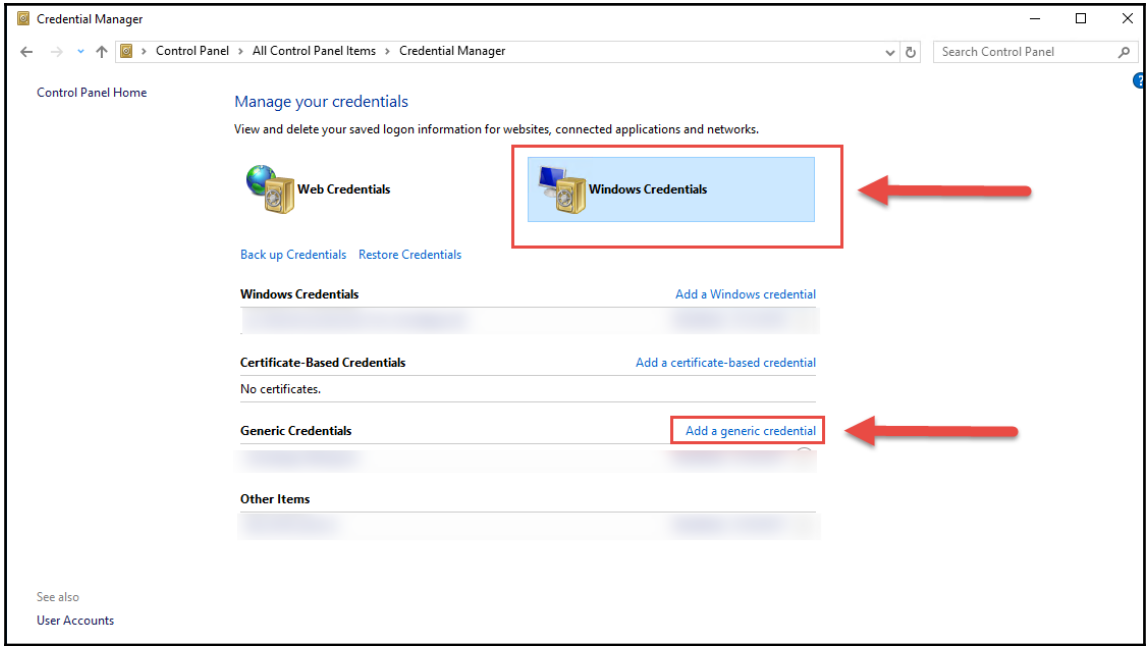

```
Administrator: Windows PowerShell
PS C:\Windows\system32> Connect-PnPOnline -Url https://...sharepoint.com/sites/... -Credential
cmdlet Get-Credential at command pipeline position 1
Supply values for the following parameters:
Credential
PS C:\Windows\system32> _
```

```
Administrator: Windows PowerShell
PS C:\windows\system32> Connect-PnPOnline -Url https://[redacted].sharepoint.com/sites/[redacted] -Credential (Get-Credential)
cmdlet Get-Credential at command pipeline position 1
Supply values for the following parameters:
Credential
PS C:\windows\system32> Get-PnPSite

Url                                     CompatibilityLevel
---                                     -
https://[redacted].sharepoint.com/sites/[redacted] .. 15

PS C:\windows\system32>
```

Add a Generic Credential

< > > Control Panel > All Control Panel Items > Credential Manager > Add a Generic Credential

Search Control Panel

Type the website address and your credential information

Make sure that the user name and password that you type can be used to access the location.

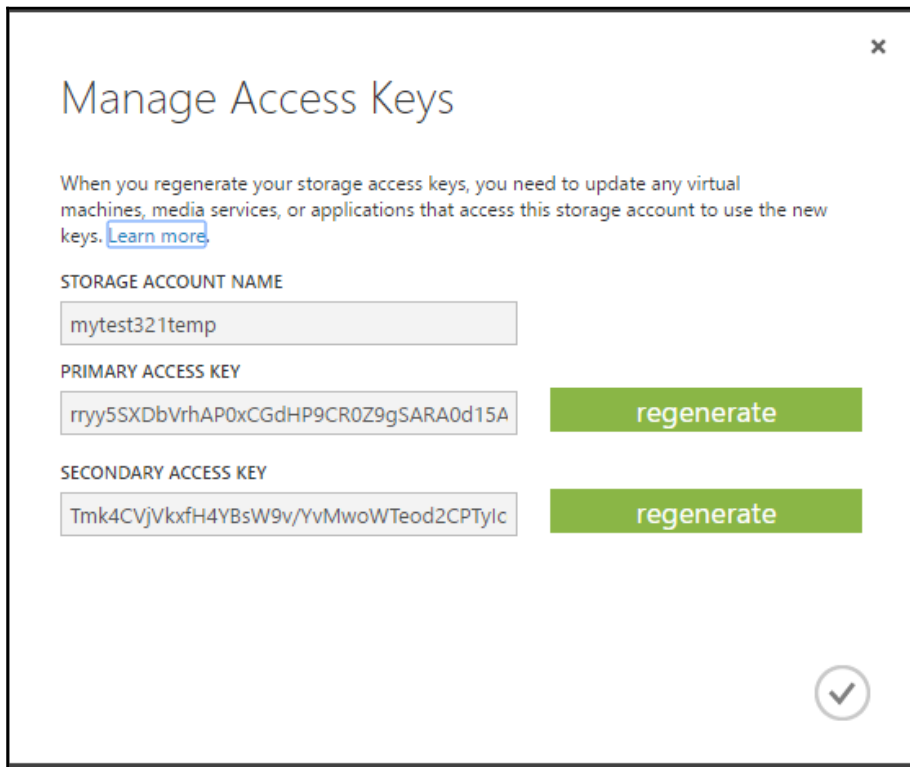

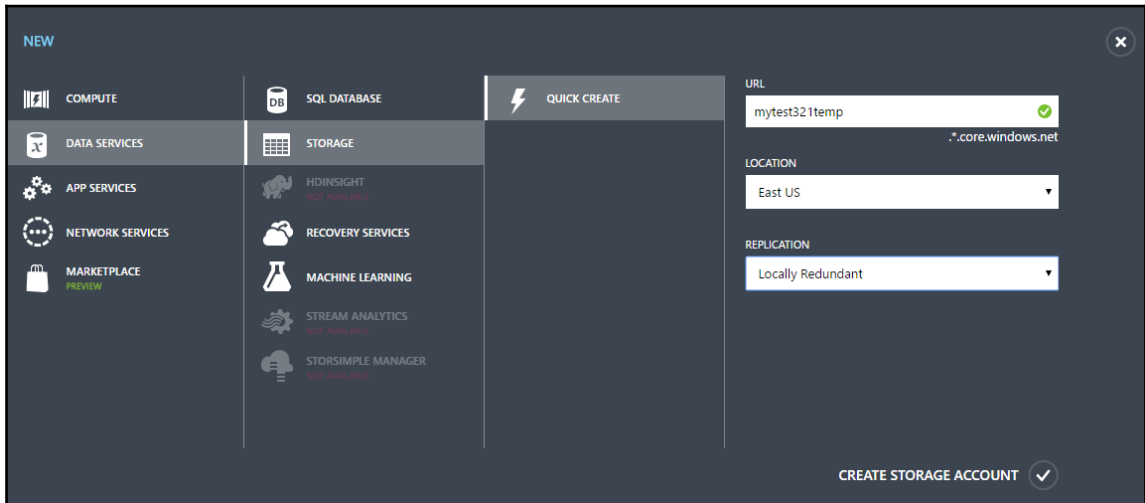

Internet or network address:

User name:

Password:

OK Cancel
